Thanks Dale. Well, I found a great program online called Soundcard Oscilloscope. I hooked the AF out of the PFR3 to the computer soundcard, ran the program and did the IF alignment that way. Piece of cake! :) The program is free for private (non-commerical) use and was very intuitive to use.

On another topic, I finished the transmitter section of the build tonight and discovered that both the gray toroids supplied with my kit were FT37-61's and not FT37-43's. I usually use a program called Mini Ring Core Calculator to calculate the ballpark expected inductance of a toroid I'm winding and then check it before I install the toroid.(The same program also allows you to calculate wire length for the number of turns required - very handy!).

8 turns on an FT37-43 toroid should give around 20uH inductance, but when I checked after winding it, it measured only 3.5uH. A quick calculation shows you'd expect around 3.5uH for 8 turns on an FT37-61. I checked the other gray toroid in the kit and that was the same: an FT37-61. Fortunately, I have a supply of FT37-43's on hand here and substituted one of those - winding 8 turns on that gave me the expected 20uH and I used that for L7.

I'm not sure what the practical significance would be of having L7 with an inductance of 3.5uH rather than 20uH, but I'm mentioning this only in case it is relevant to others who are about to wind L7.

On with the LPF stage now...

73,
John

Hi John,

Searching for "Soundcard Oscilloscope" returns multiple different results.

Could you provide a link to the particular software 'scope application you used?

Thanks for the report on the wrong toroid cores. Unfortunately, that could be a 'show-stopper' for some builders.

>
> Hello Group,
>
> I'm progressing with my PFR3 and would like to share a tip in case it's helpful to anyone.
>
> I have sensitive, well preserved high frequency hearing and one of the difficulties this causes is that I can easily hear high frequency white noise hiss, a common features of many audio amps, including the LM386. I don't like it because it's fatiguing, detracts from aesthetically pleasing audio and degrades S/N for weak signal listening. Some amps are better than others, but when I was testing the PFR3 receiver, I was surprised that the white noise in my unit was quite obtrusive. In fact, very obtrusive. Using my several sets of earphones, it was present with them all and clearly heard with the AF gain closed right back and antenna disconnected. Just the usual white noise hiss.
>
> My usual "fix" for this is to use either a low pass audio filter on the headphone line, or to add some resistance in series with the headphones. I tried a "headphone attenuator" in line with the phones connected to the PFR3, added some resistance that way and, happily, the hiss disappeared.
>
> But I was puzzled, because I also have a DualBander designed by Steve and that little rig is distinguished by superb audio through phones and not one bit of white noise hiss. The reason I was attracted to the PFR3 was because of the audio of the WDB and my recollection was that the design of the audio stages around the LM386 in both rigs was identical. So I got out the schematics again and compared them and I found that there is a difference - the Dualbander has a 270ohm resistor wired in series with the headphone AF line. The PRF3 doesn't.
>
> So, with a little minor surgery to the PFR3 board and a single resistor, the PFR3 hiss is eliminated and the audio is every bit as easy to listen to as the DualBander.
>
> I experimented with different values of resistor, listening for the effect on the amp white noise and noting the trade off against reduced AF gain resolving a 1uV signal from my signal generator. Somewhere between 180 and 270 ohms seemed optimal, so I used a 220ohm resistor. The signal gain is still sufficient: I can easily hear the 1uV (-107dbm) signal in a normal room with the AF gain control open 2/3.
>
> Perhaps this will help someone else with sensitive high frequency hearing enjoy their

PFR3 even more.

Hi Steve,

Sorry, I should have given the details of the Soundcard Oscilloscope.
I found it here: http://www.zeitnitz.de/Christian/scope_en?mid=1022

There are a lot of clever features to play with, but it made doing the IF adjustment very simple using just the most basic oscilloscope function. The digital frequency counter is handy too. No interface required, of course, just plug from the AF out of the PF3 to the MIC plug of the laptop. It's free for private use, but supportable by donation.

About the toroids: Yes. They looked like all gray FT37's do, they were just the wrong mix and if I hadn't checked the inductance of the finished toroid, I'd have been none the wiser. I'm not sure what the significance would be of the error for that RFC. L7 is interesting. If you look at the design of the Weber DualBander (same transmitter architecture as the PFR3) that particular RFC has 15 turns(65uH) in the Dualbander, and 8 turns (20uH) in the PRF3. That leads me to think that the inductance of this RFC is not super critical in this design, but still there must be a minimal level of inductance required to do the job at the lowest frequency of operation and you'll get to that level lot sooner with only 8 turns on an 61 ferrite mix!

73,

John

Are you measuring into a dummy load? Remember, if you are measuring into a mismatched load, the power readings on the meter will be misleading.

3179. Re: Power output

Yahoo group: pfr3_group
Date: 2011-09-21 23:24:09 UTC
From: John Farmer
Topic: 3175 Message: 3179

Hi Grant,

Hmmm.. I'm suspicious of nearly all power meters, especially when the specs of even the best units on the amateur market quote an accuracy of 5-10% of full scale deflection - and that's in a recently calibrated meter. The Bird series quote 5% FSD, if I'm not mistaken.

I now check all my unexpected power readings by measuring RF voltage across an accurate 50 ohm dummy load and then doing the maths.
When I started doing that, I got some interesting surprises and in the process learnt a lot about the information my power meters were giving me.

There are several ways you could measure RF voltage, and I'm not here to promote, but Elecraft produces a great little dummy load and peak-reading RF probe combined, good up to 20W or so. Because it's an integrated unit, you simply attach the leads of your DC voltmeter to measure your RF voltage across the load directly. It's one the most used bits of equipment in my shack.

Let us know what you find out in your investigations.

The easiest way to measure power is with a 'scope. Hook a 50 ohm load across the final and measure the sine wave output. For 5 watts, you should see 45V P-P. You will need a 50MHz or greater 'scope for measuring 20 meters. Since 'scopes are calibrated devices, your accuracy should be very good - better than 5%.

Hi John and thanks for that link.

For me, nothing beats a 'Tek' :-) however I 'Elmer' a few guys via the Internet and sometimes it would be good for them to be able to look at simple audio waveforms when I'm trying to explain how things work. I've looked at a few of the soundcard based 'scopes out there but hadn't narrowed down the choices.

I don't remember anyone ever mentioning using a PC 'scope to align the PFR3. That's a great idea.

Best of luck with your magic Yellow Box.

Date: Wed, 21 Sep 2011 22:58:13 -0000

Hi Steve,

Sorry, I should have given the details of the Soundcard Oscilloscope.
I found it here: http://www.zeitnitz.de/Christian/scope_en?mid=1022

There are a lot of clever features to play with, but it made doing the IF adjustment very simple using just the most basic oscilloscope function. The digital frequency counter is handy too. No interface required, of course, just plug from the AF out of the PF3 to the MIC plug of the laptop. It's free for private use, but supportable by donation.

About the toroids: Yes. They looked like all gray FT37's do, they were just the wrong mix and if I hadn't checked the inductance of the finished toroid, I'd have been none the wiser. I'm not sure what the significance would be of the error for that RFC. L7 is interesting. If you look at the design of the Weber DualBander (same transmitter architecture as the PFR3) that particular RFC has 15 turns(65uH) in the Dualbander, and 8 turns (20uH) in the PRF3. That leads me to think that the inductance of this RFC is not super critical in this design, but still there must be a minimal level of inductance required to do the job at the lowest frequency of operation and you'll get to that level lot sooner with only 8 turns on an 61 ferrite mix!

73,

John

Hi Grant,

Well, that's about 7.8 Watts gross power -input- power and you can't have more power output than you're consuming.

From that measurement I would say your PFR3 is working fine but something's awry with the measurements. I'd right away jump on the accuracy of the MFJ but you say other QRP rigs you own measure in the ballpark so we can probably rule that out.

I'd suggest going with a properly calibrated RF Probe for the measurements. See N5ESE's web page for information on how to build and calibrate. http://n5ese.com/rfprobe1.htm

Best of luck.

Dale, I have just re-read the readings to determine the current drawn on key down and it's pretty much 650mA on all three bands. The power meter (MFJ) indicates around 8W out.

That works too. OR, take the tx to an antenna, and use the BLT to tune with... compare the current and voltages, if an external tuner is available, insert meter, use external tuner, and measure there.
Some way or other, there will be an answer.

An update. I have replaced the connecting cables, and changed to another SWR/Power meter and still got the same high power reading, about 10W. Then I installed new AA batteries to see if that would make the difference (I have been using a regulated 12V PS) and no change. So next I will build myself a low power rf meter and see if that produces something different. I'll report back in due course.

Hi Grant,

I don't want to harp on here, but rather than making up another meter, I'd just put together a peak reading RF probe and measure the RF voltage across a good 50 ohm dummy load. Better still, can you borrow an oscilloscope and measure the RF voltage that way, as one of the other guys on the list suggested? Problem is, if you make up another RF Power meter, how are you going to calibrate that accurately without some way of measuring RF voltage?

Much more reliable to measure the RF voltage across a dummy load and do the maths. That's how I calibrate all my power meters here. The only exception in my LP100A. It's one of the very few RF Power meters I trust and it came to me very expertly calibrated by Larry. It gives me the same answers as my dummy load and RF probe, so I believe it now :). Can you sense my inherent distrust of power meters? <grin>

Just my 2c worth!

Keep us in the loop.

Hello Grant
I read your message and responses
Sure there is a problem in the power measurement,
the current consumed by your pfr3 seems normal, but your power meter is not good for these little power or dummy load or a problem with the measuring line.
Many power meters are well, and if there is a bit of ROS is a disaster for the measurement.
I think you have a friend who go to a dummy load and a power meter for low power, and you can properly adjust your pfr3.
I am fortunate to have an old bird for years and a 10 W probe 2-30 MHz, it allowed me to set a WM-2 I installed a kit, and I modified with BNC sockets and coaxial cables with Teflon rigid core and shorter connections, the measure is now good for 5 mW to 10 W in 3 ranges of measurements, even though it rises up on VHF if the assembly is made with care.
A power meter for low power and a good dummy load is required for assembly and then you better go to a club or a friend that to this, otherwise we may not be happy with his work.
have a good day
see you soon

Except that Grant said, "All my other arp rigs read as they should" (I'm sure 'arp' is a typo). What would explain that? Maybe his other rigs aren't 5 Watt rigs and his MFJ reads high?

Be that as it may, trying to read QRP levels on a 941E is 'iffy' because that's -way- down on the 30 Watt meter scale.

Grant, are you using a known good 50 Ohm dummy load?

3198. PFR3 completed and thanks to ON6WJ for the toroid trick..

Yahoo group: pfr3_group
Date: 2011-09-25 13:40:50 UTC
From: John Farmer
Topic: 3198 Message: 3198

Hello Group,

Just to say I've completed my PFR3 and it's working FB. I'm waiting on some hardware from Doug and then I'll box it up.

I have 5.1W out on all 3 bands after a little tweaking of the toroid turn spacing. Thanks to ON6WJ for his posting and photo from 2008 about the relative spacing on the turns on each of the toroids for the 3 bands. It worked a treat. Initially I was getting about 3.9W out on 20 and 30m, but adjusting the spacing as ON6WJ describes gave me 5W on all bands. It's not as simple as widening the spacing of the toroids to increase power out. You need to increase the spacing on one and reduce it on the other to raise the power output. Great tip. I would not have worked that out myself. In fact, I've only ever been able to get 3.5W out on 20m on my Weber Dualbander, no matter how I fiddled trying to widen the spacing of the windings on the 20m toroids on that rig. Tonight I went back to it and used the same trick now I have 5W out on 20m on the Dualbander too. I'm very happy.

Now I need to get on the air and use my little yellow box. Fun.

Hi

My experience is with small Black Widow Paddle, from Jerry, W5JH.. and "
I Love it!" ...small and very nice piece (I'm susing on my portable field
operations).

I like so much this paddle that I decide to purchase a PFR3 Black Widow
Paddle from Jerry, W5JH (i didn't received yet !) . I think you will
not regret.

I remember a few years back there was a JM4/MM station that was aboard a
cargo ship in the South Pacific who used to boom into Southern California.

3210. Power Dropped

Yahoo group: pfr3_group
Date: 2011-09-28 23:01:32 UTC
From: Stan ae0sl
Topic: 3210 Message: 3210

I have been using my PFR-3 every day for a few weeks (and loving it), but it seems to have developed a problem today. This morning, it was working fine on 20m with a power output right at 5 watts. This afternoon, the power output appears to be around 1 watt. It wiggles the power meter, but not by much. I have been using the same 12v external power supply at all times. I just switched to 40m, and it has the same low power output.

Do any of you have an idea what might cause this and how I could resolve the problem? Do you know what I might have done wrong to cause the problem? I had not been changing bands before the problem appeared, so that was not the cause. I had been switching the antenna between two rigs though.

Unfortunately, I bought this unit assembled because my eyes are not good for soldering any more. I am sure that will complicate the cure.

Thank you for any help you can provide.

Hi Stan,

Do you accidentally have the Tune - Operate switch in Tune? That would drop the power by about 1/2.

High VSWR or transmitting into an open could cause damage.

How much current is drawn on transmit? If it is considerably less than the current specified in the manual then I would suspect one of the output transistors has croaked. If the current is near rated then look for problems between the transistors and the antenna connectors. Also check D7 to see if it is leaky/shorted.

Best of luck troubleshooting.

I suspect that I could have transmitted with very high SWR as I was switching the antenna between rigs. I don't know that I did that, but it seems the best fit with what was going on from an operating point of view. I may have to try replacing output transistors. I may have to see if I can find an Elmer to help with repairs.

Stan, A similar thing happened to me (but on 30m only) and it turned out the the one torroid (it was the 30m one) had a wire that worked loose. I opened up the enclosure and tested the connections to the torroids for continuity and found this to be the case. I resoldered and that fixed it.

Since then, I have had the opposite happen. I now get 10W out on all bands as read on my power meter, This is an ongoing thread and I have ordered a dummy load/power meter kit from Doug Hendricks and will get to the bottom of this when the kit arrives.

Steve,

Most Class E transmitters work OK into a high impedance. However, unless there is some way to limit the current, a low impedance or short will take out the MOSFETs real fast! I am not sure if Steve included any current limiting in the PFR-3.

Hi Steve,

I suppose if you were to work into a capacitive load, you could get some big time spikes. Mr. Weber probably added the zener to protect against that scenario. I am not sure if he is using Class E but the BS-170 MOSFETs don't do well in linear mode. With the switch mode of Class E, they don't have to dissipate much power. If he is driving the BS-170s with a square wave, then it is Class E. When you drive a high impedance load with the BS-170, you basically just get less current than at 50 ohms. However, as the impedance goes down, somewhere around 1.5-2.5Amps, the MOSFETs give up the smoke. ;-) The good thing is that they are very low cost. They are so low cost that it does not make economical sense to add protection for them. They cost a lot less than the protection would cost (adding $2 worth of parts to protect a 10 cent device don't make any sense). ;-)

3218. Antenna for QRP Portable

Yahoo group: pfr3_group
Date: 2011-10-02 03:22:52 UTC
From: Stan ae0sl
Topic: 3218 Message: 3218

I am looking for suggestions and/or success stories for antennas that can be paired with the PFR-3 for portable operation in parks, etc.

I am leaning toward a simple single-band resonant dipole fed directly with ladder line directly or through a 4:1 balun. I hate to limit the rig to one band per antenna, but I don't want to make the BLT work too hard either.

Those of you who take this little yellow box on the road, please let me know what kind of antenna do you use? Do you take a battery-powered QRP SWR meter or do you just rely on the SWR bridge in the unit? Do you use any sort of multi-band antenna?

Thanks for any information you can share.

From: Larry Makoski
Topic: 3218 Message: 3219

Stan,

I take two wires - one cut to 67 feet and the other to 34 feet. The 67 footer goes up a tree and get connected to the red terminal and the 34 footer lays on the ground and gets connected to the black terminal.

http://www.njqrp.org/n2cxantennas/halfer/halfer.html

It tunes up beautifully with the PFR3A's built in tuner no sweat! And it works on 40 and 20 meters very, very nicely. I used this set up for Flight of the Bumblebees in July and did very well. I was very happy with it. The beauty of it is that you really only need one tree - not two like you need for hanging a doublet or dipole.

Stan,

A 44ft center fed doublet is a popular antenna that works pretty well on 40, 30, and 20. On 40 meters it is shorter than a ½ wave dipole but the tuner should handle it ok. On 30 meters it is real close to a ½ dipole and the tuner again will load it. On 20 meters it is long but will tune up. You may need to experiment with the length of the ladder line. The ladder line will be transforming the impedance of the antenna to something else. You should be able to find a length that the tuner likes on all bands. I have used a slightly longer antenna with good success. I have used a 53 ft long antenna fed with ladder line. It will work much like the 44 ft model but maybe a bit easier to tune. It is best to stay away from a 67 ft dipole since it will be hard to tune on 20 meters. Something resonant on 30 meters would work OK. Instead of the 44 ft doublet, you can make 46.5 ft long and be resonant on 30 meters. When you are using ladder line, it is not necessary to use a resonant antenna. Any of the sizes from 44 ft to 53 ft will work well when fed with ladder line.

Hi Stan,

I use a 34' piece of 20 ga. Wire connected to the red post and put up vertically with a 20' Crappie pole that's been inserted into 8ft. of PVC buried into the ground and a 15 foot piece of wire as a counterpoise connected to the ground post.

I tune in all three bands. It takes me less than three minutes from the time I open the back of my van to the time I'm on the air.

Check out Lynn's (NG9D <http://www.youtube.com/user/NG9D>) video of the setup I'm talking about, that's where I saw it and it impressed the heck out of me.

You must set tha up as a sloper with the counterpoise directly under the sloper half-wave rather than as an inverted-L. I will have to try that configuration. The simplicity of an antenna up a single tree is attractive.

Topic: 3218 Message: 3224

I have tried the following and it seems to work well on all three bands. I use a only a single wire of 25 feet connected to the red terminal in an L configuration. That's it. This length is the longest I could make it without getting into high impedance trouble on 20 meters. The problem is getting a single small antenna to work well on both 20 and 30. This is a compromise but seems to work. The longer the better for 40M operation, otherwise the feed impedance is too low.

You will find the tuning VERY touchy with this antenna. I found the following PFR settings to work on my unit:
20M: T=L=2+, HiZ
30M: T=L=2, LowZ
40M: T=11, L=1+, HiZ

Hi Guys,

With no counterpoise, I just tested a 34 ft wire sloping up from my deck to a tree. The end of wire was 15 ft off the ground. The PFR-3A BLT loaded (Hi-Z) on all three bands with complete darkening of the LED SWR indicator. W4NSN, Gene in Atlanta (580 miles) reported RST 569 on 40 m.

Approximate dial positions (as hour hand on clock) for wire without CP:

band: load/tune,
40m: 1pm/11am,
30m: 1pm/2pm ,
20m: 2pm/3pm

Hi Stan,
I use a 34’ piece of 20 ga. Wire connected to the red post and put up vertically with a 20’ Crappie pole that’s been inserted into 8ft. of PVC buried into the ground and a 15 foot piece of wire as a counterpoise connected to the ground post.
I tune in all three bands. It takes me less than three minutes from the time I open the back of my van to the time I’m on the air.
Check out Lynn’s (NG9D) video of the setup I’m talking about, that’s where I saw it and it impressed the heck out of me.

I am looking for suggestions and/or success stories for antennas that can be pai red with the PFR-3 for portable operation in parks, etc.

I am leaning toward a simple single-band resonant dipole fed directly with ladder line directly or through a 4:1 balun. I hate to limit the rig to one band per antenna, but I don't want to make the BLT work too hard either.

Those of you who take this little yellow box on the road, please let me know what kind of antenna do you use? Do you take a battery-powered QRP SWR meter or do you just rely on the SWR bridge in the unit? Do you use any sort of multi-band antenna?

Thanks for any information you can share.

NG9D:

Thanks for the info on the 34-ft sloper without a counterpoise. I will have to try this simple option. Do you believe that a CP would be needed if the sloper reached nearer to the ground, increasing coupling to the ground?

I am a little confused by the tuner settings that you listed. Does the "am" or "pm" simply indicate which side of the 6:00 position the dial is turned to? I assume you are not talking about a 24-hour clock.

Hi Stan,

The positions, for my radio, middle setting of each cap is 12:00 "high" or straight up. Depends how one sets the capacitor shaft and set screw. So, with that setting 11:00 would be a bit Counter-Clock-Wise (to the left) and 1:00 would be a bit Clock-Wise (to the right). The 3pm setting is about full Clock-Wise, or about 90 degrees from the 12:00 setting.

As for position to ground, I have played with antenna heights and found that when I get close to the ground, the performance is really degraded, even if a match is obtained. One way to prove this is to listen to signals when lowering antenna to ground. Use a rig with a speaker and move the antenna around while listening. The average height of yesterdays antenna was less than ten feet. That position seems to maximize high angle radiation and good for regional work, but for distance I get better results with the wire erected more or less vertically*. Oh, I tried a six foot CP too, that tuned nearly the same as the wire without CP (dial settings changed slightly, but just as narrow tuning with a lot of trial and error tuning needed.)

For end fed antennas, you could also try an L-Network Tuner. They are simple and easy. Here is a commercial L-Net tuner with IC703:
http://www.youtube.com/user/NG9D?feature=mhee#p/u/51/JD-DjQuL7bk
Here is a breadboard HB L-Net tuner, used with an off-center fed sloper:
http://www.youtube.com/user/NG9D?feature=mhee#p/u/3/zGkC321Cwl8
And here is that sloper working on all 3 bands with the internal PFR-3 BLT and HB feeder:
http://www.youtube.com/user/NG9D?feature=mhee#p/u/2/VXo0XucRpt0
I think the doublet antenna is a good solution for the PFR3A BLT too: here is a 50 ft doublet with HB feedline:
http://www.youtube.com/user/NG9D?feature=mhee#p/u/1/qaUN9m2u1pQ

3232. SWR Bridge Use

Yahoo group: pfr3_group
Date: 2011-10-05 20:13:42 UTC
From: Stan ae0sl
Topic: 3232 Message: 3232

Ok, I need the "for dummies" version of instructions for using the SWR bridge. I rarely see any LED darkening that I can detect, and yet my QRO power meter is not showing even the slightest deflection of the reflected power needle when I have it attached to the PFR-3. Also, I am routinely getting signal reports of 569 and 579 on the PFR-3 from the shack even though it would appear that I am not getting the antenna tuned.

I have normally been using the PFR-3 from the shack connecting to a 200 ft. inverted vee. I usually tune the antenna with an external manual Palstar tuner while it is connected to my FT-950. Then I switch the antenna and pre-tuned Palstar tuner to the coax connection on the PFR-3 and attempt to fine tune with the BLT. I have seen spots where I could see the LED dim, but 95% of the time I can sweep the LOAD control *VERY* slowly stopping every 10 degrees or so, without seeing any dimming.

Today, I took the rig out with a sloper 34 foot wire and 15 foot counterpoise on the balance line connections, and I could not find a match with the BLT.

I believe that the problem is my technique with the tuner controls, but I don't know what I am doing wrong. I sweep very slowly with the load control looking for the slightest dimming. If I do not see that anywhere, I stop every 10 degrees and then slowly sweep the tune control at each stop. I usually sweep first on the Hi-Z setting and then repeat with the other.

Do you have any advice on how I should be adjusting these controls? I will need to get this matched well if I am going to be successful using the rig in the field.

Thanks for the help.

Hi Stan,

Your technique sounds basically sound to me.

When connected to an antenna, do you hear band noise? If not, are you certain in that S11 is optioned to the coax connector position? I would suggest double-checking its proper operation using an Ohm meter.

Are you first'peaking' the internal tuner controls for highest band noise? That gets the internal tuner controls 'in the ballpark' after which you can do the fine tuning.

Since your Palstar is already adjust for a low impedance source, do you have the internal tuner optioned for low impedance (S10 "Low Z")?

Have you tried adjusting the internal tuner while using a 50 Ohm, non-reactive load at the PFR3 antenna port? If you cannot get a LED dim using that configuration, there's something seriously awry.

Once you get the hang of using the internal tuner, I'd recommend ditching the Palstar when using the PFR3 in the shack. 2 tuners is just more loss.

Yes, I hear band noise or signals when attached to an antenna. What has me puzzled is that I do not hear differences in the level of the band noise or signals as I sweep the LOAD and TUNE caps. I have made lots of contacts with good reports using this odd two-tuner configuration, but it does seem wrong.

The front end gain of the rx, and the effect of the preselecter, covers much of the selectivity afforded by the tuner. If one listens very closely, the general peaking may be heard when the tuner controls are swept through their range. That will get into the ball park. The other note of interest is that the tuner usually has very sharp peaks and it slips through the peaking while using a rx, very very quickly, with most antennas. Overall, it sounds to me that all is well in the little yellow box. Yes, it does seem unnatural, to those of us that are used to tuning and tweaking for max. Most of that has all been done for us with the very smart design work already acomplished. Good Dxing, and have a great day,

OK, Stan.

Guess that was a stupid question. Of course you can hear band noise, otherwise you wouldn't be able to make contacts, HA!

What about the rest of my questions? Especially the dummy load one.

Well, its not 'wrong' per se. You are starting out with a load that has worked for you. Just not very efficient on the long run. The best setup is no tuner and an antenna that presents a 50 Ohm load but that is seldom possible.

I am going to have to borrow a dummy load from a friend and try balancing that with the BLT. I am also going to take yet another pass at balancing a pre-tuned antenna system. That should present a lo-Z load. I suspect that I am not being as patent with the knobs as I think I am. I am trying to peak the controls for highest band noise, but I frankly can not hear ANY changes in band noise level as I sweep the controls. Again, I am probably not being sufficiently patient as I turn the knobs.

IF you use a 50 ohm resistor, or a standard dummy load, the tuner should be switched out of circuit. It isn't to be used with a low resistance. However, if you want to practice tuning into an open line or a high impedance load, you may try a CARBON resistor no larger than 1 watt.. but parallel 4 or 6 of them to make a 4 - 6 watt load. Using a 1 watt rating tends to omit the wirewound resistors. So, with 6 in parallel, you would need 6 ea. 3.3k resisters. (3.3k divided by 6 =
550 ohm)... (and I didn't use new math either, just my fingers, or was that calc?) Solder the ends together, and attach a short pair of wires, to reach the red and black terminals on the PFR3. Tune, SLOWLY thru and watch the led dip. No problem, right? (Not everything in this world has got to go 200 mph. Or the speed of light....really) However, once you get the hang of tuning, and... if you normally use the same high impedance antenna... pencil notes will make tuning up again, a whole lot faster. You can return to the same settings time after time, and quick checks will make it very fast to get on the air. Have a great day,

OK, just make sure that the dummy load you borrow is a good one or it will not dim the lamp. Actually, it may dimly illuminate because the bridge resistors are 51 Ohms.

With S8 in "Tune", S9 in "Coax" and a 50 Ohm non-reactive load attached to the BNC jack the LED will extinguish. If it doesn't dim completely or at least considerable, there's something wrong in the bridge. section.

Another thing to try is to do the same thing except, instead of using a dummy load, connect your antenna through your Palstar to the BNC jack. Then try dimming the LED using the Palstar tuner controls. That will confirm proper operation of the bridge.

BTW, I agree w/ Dale; sounds like your PFR3 is, for the most part, working just fine.

It's worth mentioning again that most, if not all, Z-Match tuners can be finiky to adjust to the best setting that transforms the load to 50 Ohms. It's not a bad thing, just the nature of the beast.

Hello group,

new here and not yet received my kit.
And looking for german hams or german speaking hams that are use PFR-3??

Would be nice to get some information about using the rig here in middle europe with big stations on 40m in the evening, and so on.

So if there are users in Germany or around, speaking german - amessage or mail at DL1AKP@... would be nice.

73, Andy, DL1AKP

Hi Jerry
You make my lucky Day ;-)
I'm really happy to get my PFR-3 Black Widdow Paddle W5JH NR.155, and finally cpmplete my SOTA SETUP.
Tomorrow i will work for PREPARING Jamboree Scout Station but I will try to get free time to mount this KIT.
Thank's a lot for your support and help on promoting CW, DX and herlping on preserve the hobby.

Big 73s from Marq ...ct1bww

3244. Disappointed about the decals...

Yahoo group: pfr3_group
Date: 2011-10-08 10:11:10 UTC
From: John Farmer
Topic: 3244 Message: 3244

Hello All,

I finished my yellow box today and in the interests of honest appraisal and feedback, I just want to record my disappointment with the QC on the components of this kit.

When my kit arrived, it was missing the decal sheets, both binding post threads were damaged (they were unusable) and the red LED filter was creased and damaged. Not a big problem. Doug replaced the fautly parts and I continued the build while waiting for them to arrive.

So today I cut out the decals and started to apply them. Disaster. The decals broke into dozens of brittle little pieces after only a short soak. They were impossible to use. Even the smaller ones broke into multiple fragments as they were slid off the backing sheet. What a mess. I'm experienced using these decals (several previous kits went very smoothly) and I'm confident this disaster wasn't due to my technique.

So I have a yellow box at last, but with no decals. A disappointing finish to an otherwise nicely designed rig.

73,

John

John:
I have an early PFR-3 with the silk screened yellow box, no decals. I am very happy with it and how it looks. I often take it to a hamfest and leave on display as a discussion piece about QRP and the fine little radio but with a note attached; "not for sale!".

I would be willing to pay the additional cost for a silk screened chassis and end up with a product I can be proud of and proud to show. That alone makes the difference between radio or project you will not show to your friends or not. It will also go a long way to retain product value if for whatever reason you want to sell it. Seems like most other kit makers find a way to silkscreen rather than cheapen the product with a cheap decal. Raise the price as needed for silkscreen, pitch the decals. Anyone agree with me?

YES!! The early run of silkscreen does look and last a lot better than the decals, even with extra care and two coats of ClearCoat on the decals.Not knowing what the issues are for silkscreen, I can't say that I'd stand the cost of that, however, I do agree that the silkscreen MAKES the radio.

Dale:
Doug once told me the cost might go up about $35. I would be good with that for a product that LOOKS as good as it works. Without it, it gives the appearance of CHEAP. Perhaps on the smaller accessories, tuners, and etc. it would be OK for decals but not on the "main rig". So, $35 silk screen added on to a $35 accessory may not cut it marketing/pricing wise.

I do appreciate the line of products Doug has and the quality with exception to the silk screen issue. Perhaps I am just too picky on appearance.

Paul,

If the decals were like mine (maybe not John's) they were standard decals similar to those used on scale model kits. Two sets were provided in case one might be damaged during installation. Yes, my initial reaction was that by eliminating the silk screening in favor of water-based decals could only result in a marginal cost reduction for Hendricks on a per unit basis that is probably less than the amount the kit builder spends buying a can of Krylon Acrylic Matte spray finish.

Also, the process of applying the decals itself, in my case, only added marginal enjoyment and feeling of accomplishment. It did remind me of happy times as a kid building model airplanes however, and so that was a plus. After I got over these amusing thoughts I found that the materials were good quality, the installation was easy and after the application of two light coats of Krylon the decals are permanently affixed and protected from wear. So, the result was labeling fit for the purpose with a sharp look.

I've shown the completed kit to other hams who routinely ask all kinds of questions about the building process, technical details and field performance. I don't recall anyone ever asking me about the labels and I doubt most of them would have even realized they were part of the homebuilding process until I told them. My PFR-3A gets cleaned with a wet cloth periodically to wipe away accumulated grime and this has no effect on the decals.

For those builders that grew up making model cars or airplanes, applying these decals probably seems like second nature. However I have a feeling that some folks assembling the PFR-3A have never assembled a scale model kit that required the application of this type of decal, and learning this technique takes a bit of practice. If there is anyone reading this string that would like to see what is involved labeling the PFR-3A, here is a short video clip:

http://www.youtube.com/user/NG9D?feature=mhee#p/u/40/lFtlSPw7GZA

I'll bet Hendricks would be more than happy to send replacement sets of decals to John, they have been very good to me responding to parts shortages. I wasn't going to reply to this, but then I thought someone might find the decal subject as a reason not to build this nice radio kit, and that would be a shame. The decals are fine.

73,
LYNN

It would be nice to have an option to redo the front cover... with silkscreen, or order it that way, or with the decals. I know it is a tuff job to stay even with the changes folks make when the get something going then abruptly change gears,so I can appreciate all the extra effort that Doug has put into the little yellow box already. And if it were an option, the pricing wouldn't drive it outta the inexpensive marketplace either. And no.. not picky at all.. simply honest.Have a great day,

I agree with you for the most part, Lynn, having made many model airplanes, and early radio kits, I've worked with decals many times before. I messed up a few of the decals, tearing them, but, for the most part, it went smoothly. Having two sets made it very nice.

However, I also would have been happy to pay a reasonable amount to get a silk screened case, just for the looks and quality it adds.

I watched your video, and got a kick out of you sending code to describe the steps to apply the decals, (hope you weren't using a keyboard, as the code was beautiful).

P.S. Just QNIed with my PFR3 to the QRP-WSN group for the Saturday morning net, and copied QRP stations from Utah to San Diego and east to Reno and Garderville NV. with my indoor antenna in the rafters of my garage. This was about the fourth time to QNI with the PFR3, (love this rig).

Bill - QSL. Yes, you caught me! A keyboard!! By the way, the keyboard keyer is also a kit that was sold by K1EL called K20. I have it tethered to a dedicated Dell QuiteKey keyboard and the junction box contains jacks for paddle and output to rig and a 9V battery. It is a superb kit, but I think K1EL is now offering more advanced models. If the new models are like that old K20, they are top notch and reasonably priced kits.

Paul, I agree. Considering how much time and attention to detail we all put into bringing these yellow boxes to life, I'd very happily pay $35 extra to make it a radio fit to be shown off.

I'm proud of the insides of my radio, but now have no labelling on the outside, so it looks VERY homegrown. I'm certainly not proud of the appearance of the outcome of my efforts.

Lynn, I value your comments, but as I said, I have some considerable experience in the application of model decals and I've also completed at least 5 of Doug's other kits which use them. The others have gone on fine. There was something amiss with both the sheets I was sent to replace those missing from the original kit. This will be the third "trip" back to Doug with QC issues on this kit. That's detracted from the building experience for me.

The other problem I've found with using decals on functional equipment is that they are NOT very durable. Those on my WeberDualBander are wearing off after 18 months of light use around the shack and despite several layers of Krylon to protect them. I don't imagine those on my Hendricks TennaDipper will last long either, because that unit will be in and out of my portable bag to earn its keep.

Perhaps Doug might reconsider a re-run of the silk-screened cases for the PFR-3? Word of mouth advertising depends on people being proud and wanting to show off their creations. We'd all be better off without decals on this rig - it is, afterall, the top of Doug's range.

In the meantime, I need some more decals. I'm off to send another email to Doug.

73,

John

John,

Did you ever consider making your own?

http://www.decalpaper.com/?gclid=CK7gofKc2qsCFd505QodHizsSQ

I used this stuff to make decals for my AA0ZZ keyer and they came out great! You can choose any font you want and design them anyway you want.

I second the motion. Last night I pulled my PFR-3 out of storage and used it for a few hours..... mine was one of the first runs with the silk screened case. I have done a lot of water decal installation and would gladly pay a little more for a professional silk screened case. It really looks classy and even better than my best efforts with water decals. So,for any kit providers out there we hams can give up something else somewhere to pay the extra for a professional looking case. Skip the water decals.... please.

John:
I have an early PFR-3 with the silk screened yellow box, no decals. I am very happy with it and how it looks. I often take it to a hamfest and leave on display as a discussion piece about QRP and the fine little radio but with a note attached; "not for sale!".

I would be willing to pay the additional cost for a silk screened chassis and end up with a product I can be proud of and proud to show. That alone makes the difference between radio or project you will not show to your friends or not. It will also go a long way to retain product value if for whatever reason you want to sell it. Seems like most other kit makers find a way to silkscreen rather than cheapen the product with a cheap decal. Raise the price as needed for silkscreen, pitch the decals. Anyone agree with me?

Subject: [pfr3_group] Disappointed about the decals...

Hello All,

I finished my yellow box today and in the interests of honest appraisal and feedback, I just want to record my disappointment with the QC on the components of this kit.

When my kit arrived, it was missing the decal sheets, both binding post threads were damaged (they were unusable) and the red LED filter was creased and damaged. Not a big problem. Doug replaced the fautly parts and I continued the build while waiting for them to arrive.

So today I cut out the decals and started to apply them. Disaster. The decals broke into dozens of brittle little pieces after only a short soak. They were impossible to use. Even the smaller ones broke into multiple fragments as they were slid off the backing sheet. What a mess. I'm experienced using these decals (several previous kits went very smoothly) and I'm confident this disaster wasn't due to my technique.

So I have a yellow box at last, but with no decals. A disappointing finish to an otherwise nicely designed rig.

Hello David
And good morning
I must say that I am somewhat agree with you, I like the finished work, and fortunately I had two kits, decals,
despite the two as I had to bring the two sides on two sheets of Decalcit broken, and I can say that it takes great care must be very quiet.
Maybe with a lot of practice it would be correct, but if you look closely, it's not really perfect, despite a good varnish, difficult to apply because you have to know varnished several times and it is also somewhat delicate.
I think I agreed to pay a little more expensive.
In the photos it is not the default, but the eye is clearly visible leaves Decalcit under the veneer.
Well, well, it's probably cheaper so do not be too difficult

Funnily enough, my decals were OK. I must admit, I did mess up quite a few and thanked goodness for the second set. Overall, I enjoyed the process of applying them and spraying the enclosure. I think I eventually settled for about eight coats! How it lasts is another question. I am hoping it stands the ravages of time.

3260. Silk screening will return.

I have looked at all the little rigs and I have made my decisions to buy this one. However, I will wait until silk screening returns to the rig. I never was good with water labels. I would suggest that Doug try Nevada for a good price on silk screening. We have a real unemployment rate of 25 percent and I am sure he could find a good price here. Doug if you are interested I will do the leg work for you here in the Reno area.

I do think silk screening will return to the rig. It is just a matter of time until he finds the right silk screen provider. One that can provide a good service at a good rate with passion.

3261. Measuring power output

Yahoo group: pfr3_group
Date: 2011-10-13 22:44:56 UTC
From: Grant
Topic: 3261 Message: 3261

Hi, Well my Hendricks Dummy Load kit has arrived and I have built it. Using it to measure the RF power output on the different bands and using the formula P = E square/ R, I get the following results (with input voltage 12V DC and dummy load of 50 ohms):

On 40m: E = 21 4V, P = 9.1592W
On 30m: E = 21.9V, P = 9.5922W
On 20m: E = 22.2V, P = 9.8568W

Now here's my challenge: Apart from the output being way higher than the 5W indicated in the specs, if I read off the E values on Doug Hendrick's chart (in the instructions for the dummy load kit and as supplied by Tony Parks KB9YIG, DC output of around 21V should be a power output of just over 4W. Then, if I use the formula as supplied by Elecraft in the instructions for their dummy load kit, and using the voltage I got for 40m, I get a power output of 18.4948W.

Most confusing, to say the least. By the way, the Elecraft formula is:

P = [921.4 x 1.414) + 0.15]squared / 50

Any ideas firstly on the different formulae, and secondly, do I need to readjust the windings of my torroids to bring the output readings down to the 5W mark?

Grant,

I don☐t know what you are using to measure with but the best way is with a scope. Take the peak-to-peak voltage divided it by ½ and multiply by .707 to get RMS voltage. Square the voltage and divide by the impedance of the dummy load (50 ohms). If you are measuring the voltage across the dummy load with rectified and filtered RF using a DC meter, you would add the voltage drop (.6 or.7V), multiply the voltage by .707, square it and then divide by the impedance of the dummy load.

Remember, for AC signals like RF, the voltage is constantly changing, so when you measure AC voltage, it is important to specify how you are measuring it.
- peak-to-peak?
- peak?
- root-mean-square (RMS)?

This last one is what you need to use in the P=E^2/R formula. If you have one of the first two values, and the signal is sinusoidal (like it should be for a simple unmodulated carrier), it is easy to convert to RMS:
E[rms] = E[peak-to-peak]*2/sqrt(2)
E[rms] = E[peak] / sqrt(2)

This is probably the reason why you see different formulas: they probably have these conversions built into them. Also, if the signal is not sinusoidal (eg. like when you overdrive your transmitter), then the formulas may or may not be valid, depending on what assumptions were made in deriving the formula.

From: Steve Smith
Topic: 3261 Message: 3265

Short story: Use the chart. I'm certain Tony made certain it's accurate.

Long story: Yes, the formual is P=E^/R but you also need to convert from Peak-to-peak to RMS Volts. You do that by dividing the Voltage (E) by 1.414. In your case, for your 40 Meters measurement, 21.4/1.414=15.13 VRMS. 15.13^=228.98/50=4.58 Watts.

You can make your detector do the peak to RMS conversion for you by adding a divider resistor. You need to know the input resistance of your DVM.

Elecraft is measuring at the 'center-tap' of the load so the resulting voltage will be one half of what you would normall measure across a 50 Ohm load. The '+ 0.15' part of the equation compensates for the voltage drop across the diode. You can to the same thing with the Hendricks detector circcuit but my bet is that Tony Parks already took that into consideration when he generated the chart. You might drop him an email to confirm that.

Looks to me that your Little Yellow Box is working just fine!

I forgot to add a link:

"You can make your detector do the peak to RMS conversion for you by adding a divider resistor. You need to know the input resistance of your DVM." See: http://n5ese.com/rfprobe1.htm

Also, yes a 'scope is the best way to measure the p/out if it's properly calibrated and has proper probes. Sadly, few hams own a 'scope that meets that criteria. However, a simple diode detector can be quite accurate at power levels above 100 mW or so -if- it is built properly, the component values are closely measured (including the dummy load) and the meter used to take the voltage measurement is of known accuracy.

Thanks guys, this is good news. Yes, I forgot to divide by 1.414. Tony's chart looks good. I do have a CRO (an old one) so next I'll try hooking that up and figuring out how to get the readings. I presume I need to open the rig's enclosure and take the measurement across the BNC socket. Of course, I'll attach the rig to a dummy load.

Regards
Grant

Hi Grant,

The formula provided with the Elecraft dummy load kit takes into account that the RF voltage is measured across only half the dummy load (ie 25ohm) in that design. In addition, and unhelpfully, the formula itself is widely acknowledged to be in error. Ignore it. There is quite a bit of discussion on the Elecraft reflector about this. I have no idea why they have never issued a correction. Don Wilhelm, the reflector guru, provides a very neat derivation of the correct formula to use with the Elecraft dummy load and I can email that to you if you're interested. What's more, the correct formula accords with measured reality, which is always reassuring <grin>. The formula provided in their kit is nonsense.

Looks to me like your voltage figues are in the ballpark, Grant. You can use your dummy load/RF voltage kit to recalibrate your meter now.

Cheers,
John

Thanks guys, this is good news. Yes, I forgot to divide by 1.414. Tony's chart looks good. I do have a CRO (an old one) so next I'll try hooking that up and figuring out how to get the readings. I presume I need to open the rig's enclosure and take the measurement across the BNC socket. Of course, I'll attach the rig to a dummy load.

Regards
Grant

Thanks guys. What a great piece of gear the Hendrick dummy load/power meter is. I need to obtain a male-male BNC adapter now so I can attach it directly to the rig. This will make it easier to take measurements as the little pins are so small and difficult to steady the probes of the DMM to especially when trying to key down at the same time!

*Try this formula: P = [(V + .1 X .707) squared] / R
with this 14.04 = 2 watts
17.22 = 3 watts
19.9 = 4 watts
22.2 = 5 watts

The .1 is for the voltage drip in the diode
to convert peak reading to RMS use the .707

KI4FD & Grant,

Yes, you do need to take into account the forward voltage drop across the diode. But, isn't the drop across a 1N5711 close to 0.33V, rather than 0.1V?

I have made up several peak reading RF voltmeters and I measure and record the voltage drop for the diode I'm using before I put it in the circuit. For 1N5711's, it's always been 0.3-0.33V.

If you run it at 150degC then it might be around 0.1V, otherwise at room temperature you are looking more around the 0.3-0.4 mark as John says. Refer to the datasheet for typical characteristics, eg.
http://www.datasheetcatalog.org/datasheet/SGSThomsonMicroelectronics/mXyzzzr.pdf

Like most things, it depends :-)

If we are measuring around 5W, and we don't allow for the voltage drop in that schottky diode, you probably read around 5% lower power.

Thanks guys, this is terrific. I have just run the formula through for my 20m RockMite as it is very low power. On the DMM I measure 4.8V, so using the formula and using 0.3 for the diode, I get 308mW, which is just about as it should be. I am happy.

Further to my last post, the RockMite's specs say about 0.5W at 12V, but now I now it's closer to 300mW at 12V. Well mine is anyway. I also notice that the longer I key down, the lower the voltage reading is. It reduces slowly. It's nice to have a more accurate handle on how much the arp rigs are putting out because it makes it even more astounding when communicating with someone very far away!

I agree, John and that's one good way to improve the accuracy of the measurements instead of just assuming that the drop across the diode is a particular value.

3284. All W5JH Paddles sold and shipped

Yahoo group: pfr3_group
Date: 2011-10-18 02:18:01 UTC
From: Jerry Haigwood
Topic: 3284 Message: 3284

Folks,

I have shipped out the final W5JH Paddle. It happened to be PFR-3 type. Some of you have expressed concern about me closing down the paddle business. However, all is not lost. There is a company that wants to continue selling the W5JH line of paddles. It will take them a few weeks to get and running but they plan to offer the same line of paddles as I had offered. Look for them in the future. As soon as they are ready to go, I'll let you guys know who they are. They have asked me to keep things quiet for now.

Slightly OT but maybe some helpful info:

I love QRZ.com - I am a Premium Subscriber - But it is not the be-all / end-all of callsign lookups.

The callsign is good on Hamcall.net

If QRZ does not show a callsign I always check Hamcall next.

Thank you Jean Paul for the reference to my keys.

I never owned a Black Widow Paddle so, because of that, I cannot comment on their capabilities. I will say though that, because of the fact that I use my PFR3A out in the field, I found the Black Widow a bit large to keep on the radio while in transport and so, I designed a paddle that could be kept on the radio, it has a very small footprint and is a very light addition to the radio, adding a mere .8 ounce to the whole package.

Photos of the PFR3A paddles are in my folder (KG4BAS Ren's album) and in as much as I don't run large production runs of the paddle, they take a day or so to make, so there's not a long waiting period for shipment.

Thank you Jean Paul for the kind comment and yes, by all means, you have my permission to post a photo of your new key.

I hope you enjoy your paddle.

Hello Ren
Well, it's very funny because when I wrote the message I had no paddle built by Ren at home,
but the package arrived there some time in the mailbox and now I l 'I turn, thank you ren.
And I must say it is simple and light, and I could now put the pfr3 in a small box with a nurse carrying handle without taking a separate key or paddle.
So I would do a picture or two that I would add at the end of the assembly pfr3

Thank you Jean Paul for the reference to my keys.

I never owned a Black Widow Paddle so, because of that, I cannot comment on their capabilities. I will say though that, because of the fact that I use my PFR3A out in the field, I found the Black Widow a bit large to keep on the radio while in transport and so, I designed a paddle that could be kept on the radio, it has a very small footprint and is a very light addition to the radio, adding a mere .8 ounce to the whole package.

Photos of the PFR3A paddles are in my folder (KG4BAS Ren's album) and in as much as I don't run large production runs of the paddle, they take a day or so to make, so there's not a long waiting period for shipment.

Thank you Jean Paul for the kind comment and yes, by all means, you have my permission to post a photo of your new key.

I hope you enjoy your paddle.

Hi all
I find this wonderful achievement and this is probably good to the touch, but I think it's a bit big for the pfr3,

I think one key smaller and simpler is better for me, but it's just I think I think I found the solution for me,

built by a ham radio, I do not know if he wants us to talk about the list.
With his permission I would put the photo can be of the paddle as I would have received.
My decision came from the disappointment of not being able to get the paddle from the early simple pfr3

Hi Jerry,

Thanks for that such good News. I'm testemomiun that W5JH Paddles must be alive! CW and QRP enthusiastb are gratefull for that decision and NEWS. Hope that NEW Company has inside some Hams due to understand what we need .

Thanks and Long Live to W5JH Black Widow Paddles

For me I can tell you
" I'm Happy I'm using a Black Widow Paddle"

Yes, indeed, there is room for everybody.
But Ren is not paddle at all the same, it is really to be left on the pfr3, remove the yellow box,
make a few QSO with little time and pick up quickly.
That is why I am interested in this model, if I have other paddles like many of us.
If you want more precision to a longer paddle requires a more comfortable, there is no competition then.

BTW,

I do wish the new company making the Widows much success, as it will ensure that they will be available to the rest of the PFR3A community.

Ren makes a great paddle for the PFR3, especially if you are walking or carrying the equipment by hand. (or in a saddle bag) They are tuff, and work well... even after being bounced and jostled around in a saddlebag for hours. Normal care in packing prevails, however, I've seen disaster occur to other keys in that situation. Bags vs trees... or rocks... come to mind, but that's another story. The space saved by using Ren's paddle, can be put to good use by an antenna, coiled... or a snack... hmmm... no.. a beer won't fit in that saved space. Sorry. Ren also makes a great paddle for the ATS4 too. So if you want to have consistency, ... get 'em both. Jerry's paddles, for the PFR3, are more of the type, for me.. that I use when mobile, or getting "there" in a vehicle... not quite so conserned about smashing success before it happens, although his are tuff, and durable too. Guess it comes down what you prefer, the classic debate, ford vs chey.... or... going back a ways... car vs horse....? huh? yep... that's a good debate too. Or.... left vs right ... WAIT... NO POLITICS>> ok.?! I was thinking about left hand.. right hand... Have a nice day,

Hi Bill,

Go to my folder (KG4BAS - Ren's Album) in the groups Photo section, and you'll see what it looks like. The first two photo's are of the prototype (wooden) and the next two photo's are of the one I offer (Aluminum).

They are machined out of 6061 aircraft aluminum, the key sticks out 3/4" from the side of the radio, and the paddles fold down against the base when in travel mode. Weight is .6 ounce and the best part is, they're super-simple to adjust and they work!!

They sell for $45.00 + shipping. Most guys send $50.00 and that covers the key, Paypal and shipping.

If you, or anyone else want one, send me an email and I'll start production again.

Thank you for your interest,

3298. Foxhunt coming

Yahoo group: pfr3_group
Date: 2011-10-24 12:45:59 UTC
From: Dale Putnam
Topic: 3298 Message: 3298

The Official opening of FOXHUNT Season is close at hand. I have another antenna to make ready yet, how are you doing? And the weather is very cooperative, it is supposed to snow storm here in the middle of this week.. that works well. I can put the new antenna up in the storm, and since it requires all of the EDZs to come down first, I will be putting them all up in the snow and wind. So.. they will all be blessed. Look out FOXII.
Are you ready? Teams are forming... and the season's FOX lineup is looking very good. And there just might be one or two openings yet, if you are interested in jumping into the campfire, from the pot. IF that is the case, run, don't walk, run to the webpage and grab an app, send it in, join the select group that step up and have a blast of fun from that side of the fox den.
New to the idea of foxhunts? The webpage had a tutorial that is very helpful. Now is the time to jump in, learn how to handle a pileup, with the advantages of being among supportive friends. We've all had or heard the unpleasantness of the "pileup cops" ... the Foxhunts don't support that type of activity. However, since we do,... yes.. we do... all make mistakes sometimes... the ONCE is enuff... " UP" ...MIGHT be heard, but it is very seldom, and ALWAYS sent with a kind and gentle tone, to HELP someone remember to (in my case) push the -SPLIT- button. Some of us have radios that don't do split. Some of the FOXii have the ability to listen on both their tx and rx freq, and pick up both. So there is no need for the "pileup cop" activity. That being said, you don't have to feel awkward or "new" just come on in. Make yourself at home and jump on a FOX trail, grab a pelt or two, every night watch your score on the webpage, and have a grand time.
Teams are being formed, for even more excitement. Send your team roster with all the pertinent info: calls and team captain, to me please.
Watch as your team surges ahead of the rest, or not. Laugh, and have fun with it, either way.

Thanks to the Colorado QRP Club for sponsoring the FOXHUNTS!! And thank you for the bandwidth, and allowing a crosspost to the most active representative groups. By the way, there are plenty of each group, to form a number of teams of each, i.e. all AT3, or all PFR3, or AT4, glowbug, or...??

Times a wasting, don't get caught out in the woods alone... the bands are hot, don't get caught out in the woods alone, this season may just be
"The BIG ONE"... you'd hate to miss it.

Hi JPaul,

I've see your Photos long time and maybe was of final decision on purchase this SUPER Litle Radio..
Congratulations for your very good work. Well done on photos helping others during different phases .
I know that is NOT too much complicate..but still has yours secrets...specialy the Coils etc.
The true is ...You've done a good work!

Hello Marq
I'm glad it makes you want to build, I always liked the pictures of friends with details of fixtures,
because this way it "speaks" more than a written explanation.
You encouraged me to add 4 more photos that will be probably be available soon, but they are not important for the assembly.
You can find a list of very competent people who will quickly answer your questions, have a total confience,
I think that people who failed to complete the assembly of pfr3 in perfect working condition is very rare.
All problems are resolved as and when
see you soon

3306. Power Pin Jack Size

Yahoo group: pfr3_group
Date: 2011-10-31 21:40:23 UTC
From: jeffomundson
Topic: 3306 Message: 3306

This is probably a goofy question, but I am placing an order through Jameco and I am not 100% sure of the plug size that fits the external power socket on the pfr.

Does anyone know if it is the 2.5mm inner diameter 5.5mm outer diameter size as shown here?

https://www.jameco.com/webapp/wcs/stores/servlet/ProductDisplay?storeId=10001&langId=-1&catalogId=10001&pa=281877&productId=281877

Thanks for your help!

Yes, my PFR-3A (Nov 2009) uses the 2.5 x 5.5 mm plug.

3310. DFE Mode

Yahoo group: pfr3_group
Date: 2011-11-02 00:55:10 UTC
From: k6mgo@verizon.net
Topic: 3310 Message: 3310

Finally got around to checking out the DFE mode on my PFR3 today, and am having a strange thing happen.

Went to 20m, Held RIT, and got blank readout, entered the freq using the paddles, no problem. I entered "200" for 14.200, as I wanted to monitor another rig in SSB mode, (on CW).

Then, just for fun, wanted to do the same on 40m. So I held RIT, got blank readout, entered "232" as I wanted to hear "7.232" and got "-232" but, couldn't hear the freq or signal from other rig.

Why would I get a "-" in front of the numbers on 40m and not on 20m? And why can't I get the right freq?

Any help will be greatly appreciated.

73, Bill, k6mgo

Try 2320 instead of 232.

3313. FOX HUNT!!

Yahoo group: pfr3_group
Date: 2011-11-07 01:05:13 UTC
From: Dale Putnam
Topic: 3313 Message: 3313

N0UR and I will be your opening to the FOX HUNT SEASON on 80 this coming Tuesday evening (local) beginning at 0100z Wensday GMT.
We will be in the 80 acre woods on a 10 khz radius from the tree marked 3.560. Bark all you want, and remember,
the exchange is RST, state, name, pwr.... of course this is qrp, so the pwr will be 5w or less. Some of the hounds use mw pwr.
The hunt last for a whole 90 minutes. Can you find us sly wily foxii, in just 90 minutes? Come find out.

3.560 +/- 10 kc, N0UR and WC7S Tuesday night 7pm MT or 0100z Wednesday GMT. = More FUN than you'd expect!

during the hunt, comments but NOT FOX locations are heard on the QFOX reflector, and after the hunt is over, the FOXii post their logs
so you can see right off if you made it.
I have heard that the bands are in better shape than in the past, and I am holding someone to that....

Good Hunting to each of the Hounds, may we all be successful, and start the season off with a big bang.

3316. FOX - Opening Season

Yahoo group: pfr3_group
Date: 2011-11-07 16:01:34 UTC
From: Dale Putnam
Topic: 3316 Message: 3316

The Game Warden has finally given us the nod.
We have his permission to kick off the Fox Hunt Season Local time 7pm Mountain Time Tuesday evening, on 80 meters. That would be 0200z on Wednesday GMT.
The hunt will run for a whole 90 minutes.

N0UR and WC7S will be the two FOXii in the woods.

WC7S will be using all of his antennas, with a K2, within 10 Khz of 3.560Mhz. The antennas are 3 EDZs, 360 foot long, 50 foot high, fed with open line, spread around to cover the compass. Also at rx will be a vertical on a steel roof and a 90 ft dipole at 40 feet. He will be using N1MM logging, with real signal reports, so don't expect the same report all night long. With the antenna switch at hand, signal strength will vary almost instantly, sometimes between your call, and the answer. With the blessings of the prop gods, goddess, and Murphy, the band will cooperate, and we will open the season with a BANG! (oh.. maybe that was too close, spooked the fox, you know, loud noises and such)
In the effort to grab a pelt, it may work well for the fox to advise "up or dn" 1 or 2. IF that happens, try to spread out from the exact 1 or 2 distance. Make one call, and remember, a difference in timing helps.

Let's see... exchange
real RST, STATE, NAME, PWR
that should just about do it... a final "TU" or otherwise "QSL" and you've got yourself a brand new season pelt! That easy.
For additional information - check out - http://www.qrpfoxhunt.org/winter_rules.htm

Note: Teams registration is still open, if you have a team to be registered, don't wait too much longer.

I'm convinced that the hounds in our FOXHUNTS are a step above, with skill and very much the gentlemen of the hobby.

"It's

a fine fox chase, my boys!"

3317. dummy load -- 55 ohms?--

Yahoo group: pfr3_group
Date: 2011-11-08 14:34:25 UTC
From: jeffomundson
Topic: 3317 Message: 3317

I am getting ready to test the power output of my pfr. I put together a dummy load using two 5w 100 ohm resistors connected in parallel. The issue is that when I tested the resistance with my meter, I get 55 ohms. Is there any problem with using this as a dummy load and to test my output as long as I substitute 55 ohms in my power equation?

p = v(rms)^2/z

I added a capacitor and diode to filter and smooth the output...

Thanks for any assistance!

Hi Jeff,

Congratulations on finishing your PFR!

Yes, you can do that but be aware that will give you the power at 55 Ohms and it will not be equivalent to the power output at 50 Ohms. It will get you into the ballpark, so to speak.

What caught my attention is that you say your resistors are 5 Watt. Are you certain they are non-inductive? It has been my experience that few resistors types of that dissipation are non-inductive. Resistors that exhibit any significant inductance are useless as RF dummy loads.

Best of luck with your testing.

Thanks for your reply, Steve. When you say the power output will not be the same as if I were using a 50 ohm load, I assume you mean that the voltage I read on my meter will be different. But if I take the square of the the rms equivalent of the reading and divide that by 55 ohms (my load), won't I get as accurate a reading as if I had a 50ohm load and divided by 50? I'm new to this so I might be overlooking something...

Thanks for asking about whether the resistors are wirewound... I thought I ordered non inductive resistors because they were labeled metal oxide, but I just looked again and noticed that they are wirewound :-(It's better to figure that out at this stage, though... I guess my question is moot, but I appreciate the response. I guess I will try something different.

From: Dale Putnam
Topic: 3317 Message: 3320

I'm seeing this late, so forgive me if I have missed a key issue. Using a 55ohm load and correcting the math, will work fine, except for one small detail. The PFR3 is designed for a 50 ohm load, it works into other loads, but will not be accurately reported because when 50 ohm is used, the circuit works differently than it does with 55 ohms. This is only accurate when the attached tuner is switched or connected out of circuit. It goes for any commonly accepted ham radio today, They are all designed for a standard impedance of 50 ohm. The tuner attached will make this happen, or adjust the actual impedance of the feedline to 50 ohm that the transmitter expects.
The Tayloe circuit (led indicator) in the PFR3, is also designed to be accurate at 50 ohms, it however is not as critical as the tx, when used at say, 55 ohm.
As you have id'd, the wirewound resistors aren't a good choice, the carbon resistors, (usually max rating is 2 watt) will work fine.

Hope this helps,

Received my PFR3 kit last week and just found time to sort and inventory all the parts. In reference to message 3170, my Ft37-43 toroids are indeed Ft37-43's. I wound 10 turns on one and the inductance closely matches the Amidon data sheet. All other parts were present and accounted for, although I have a few extra caps.

Hi all
I had not watched with attention, it seems to me that the manual is much more comprehensive than what I received as I built my pfr3.
or when the workbook that you see is like mine, made with information from other ham radio, that's why I put my ring mounting yellow
on the site, to help friends as well.
I also see a thing I did not push on the protection, because I just stems protruding from the hole, I try what I could make to be more stable
and more beautiful because the rod will easily all directions
Good luck for the assembly, which is a great adventure, this is extra ordinary pfr3 really is the best I have a small QRP!
and obtained using the list is also great
So long and 73

3325. Kit Building

Yahoo group: pfr3_group
Date: 2011-11-21 16:36:06 UTC
From: Stan ae0sl
Topic: 3325 Message: 3325

I am primarily a PFR-3 user these days while my "main" rig gathers dust. I LOVE this rig for QRP operation. However, my kit was built by another ham because I lack confidence in my kit building ability. I recently got a nice variable temperature, multi-tip soldering station, and I want to start building some kits.

My question is where should I start? I could try another PFR-3, build another type of QRP rig, or build a small test equipment project. My last kit building experience was a couple of small Heathkit projects nearly 50 years ago. I have never soldered any SMDs, but I would like to learn. I will eventually build a PFR-3, but maybe I should start with something smaller to build confidence.

Are there any other projects that you would suggest, or should I plunge into a PFR-3?

I always recommend test equipment. Unless you really need another rig (and it sounds like you don't), simple test equipment give you practice soldering and also confidence builders when they're finished. Plus you have something you can use for testing/troubleshooting future projects.

Here are some I recommend:

http://norcalqrp.org/s1s9generator.htm

http://qrpkits.com/dummyload.html

http://www.ohr.com/wattmeter.htm

Also read Doug Hendricks article: "So you want to be a builder, Huh?"

http://4sqrp.com/builder/builder.htm

Best of luck with all your projects.

Hi Ray,

The definition of "Best" depends upon the application. Fixed? Portable? What support(s) available, etc.. Give us more info..

Generically, you want somthing as long and as high as is practical. For a few fortunate folks, that might be a 4 element Yagi!

I recently built an antenna analyser, which was a great kit:
http://users.on.net/~endsodds/analsr.htm

If you want to try your hand at surface mount, the softrock software defined radio kits are great, and will teach you a lot about software defined radio:
http://www.wb5rvz.com/sdr/

I built the RX Ensemble II, which is a general coverage SDR receiver 160m-10m, and I built the RXTX, which is a 1W transceiver (mine covers 40-30-20m, but there are other options too).

Have fun!

Hi Stan
Ah, I'll tell you a secret, the pfr3 is like a good beer, once you found one that goes well, we can not see the other, even in painting ...
I think you're going to have to build a pfr3, but there are not many surface components in the pfr3 or it is that you ask Doug to give up the delicate parts ...
There are other kits that pfr3 course, but for me it's the one who gave me the most fun to build, or when you must choose another model Hendricks.
For pfr3, it is possible to add a rechargeable battery pack and even a small amplifier and a built-in speaker.
I'm kidding, of course, there are other kits, everyone has the right to live of his business ...
It is certain that, mount kits and troubleshoot its products is one way to understand, after a time we want to do something home made, and this is the result.

Hi Ray,

Are you referring to the chip just below the LED readout? If so, that is U7, the micro-controller and yes, in the board orientation you mention, the printing reads 'normally', left to right. The notch in the chip should be to the left hand side.

You may have a micro-controller that is not programmed. It has been an issue that cropped up in the past several months. Does your chip have a dot of paint on it? If not, it is most likely not programmed.

The "backwards" chip problem that occurred on some boards was the reference oscillator, U10 but that wouldn't cause a failure of the display to illuminate unless there is a problem on the 5 Volt line. Check for 5 Volts on U5, pin 3 and U7, pin 1.

No, that is not a valid indication. The dots haven't been used in some time, as the current crop of kits already have the required firmware updates programmed into the chip.

No display means the processor is not pluged in the correct direction (no harm is caused if it's in backwards, it just doesn't work) or it is not getting power.

That's good to know. I learn something new every day :-).

Also Ray, if you have 5 Volts on pin 1 of the micro, power off and look for pins that may have 'missed' the socket. If you see none then remove the chip and check for pins folded over. Doesn't happen often but it does happen.

Making good progress! Smoke tests 1 & 2 were successful. I was a little worried about T1 because my T1 leads didn't line up with the holes, but I must have gotten the right leads into the right holes because the receiver is working well. I was copying a ham 200 miles away with no antenna at noon today. Now working on the transmitter.

Hello Ray
I would not put the hot glue for you, not silicone glue or some special wax that melts at a soldering iron.
If we repeat the transformer is easier, I made a mistake for the T1 (I am a champion for that!) I was happy to take it off easily and cleanly again.

Hi Ray,
I wouldn't recommend glue at all.. I will preface this with, I've not seen any of the coils break loose from use. I have seen them broken loose with fat fingers, and rough handling. IF the leads can be tightened, they will hold the core securely. IF you can't do that, and are still concerned, I have used candle wax, it is easy to remove, and holds secure. However, don't apply the wax until you are certain the radio rx correctly, with the correct and adequate sensitivity. Otherwise, you will be working the wax multiple times.
Good luck and have a great day,

Topic: 3344 Message: 3348

Good evening everyone
It is possible to use the hot glue gun, but it's easier to put it into taking a part of the glue stick, cut into 4 in length and with an old soldering iron pane thoroughly cleaned in order not to residual carbon or metal.
There must be just a drop below, or a small drop on each side of the torus which is based on the circuit board.
And above all it was not until the end of assembly for the torus, as it is useful to move the coils to balance the power to 5 W of the 3 bands, and just as we are sure we can stick slightly torroids.
For the reception, we must ensure that the best signal is opposite numbers of the bands, because if the torus T1 is not "OK" there may be the best setting outside of the race of the capacitor, check that the agreements bands 7 MHz and 14 MHz are well before the stop of the capacitor, wait paste, sometimes it does not go well, and it is regrettable to go too fast ...
I prefer the light brown wax that is special for this purpose, and always in very small quantities.
have a nice day

Hi Ray,you don't need anything but if your asking then go ahead and use some heat gun glue because it will give you satisfaction and it won't do nothing but make it neater looking and better then trying to pull the wires through the board tight. Bob AF2Q

Hi Ray,

I agree with the other builders' advice that hot glue, wax or any other type of coil finishing treatment is not needed for mechanical strength or frequency stability.

Ray and others interested,

If you want to do CW in digital modes, look at the NBEMS suite of programs. Fldigi, the main part of the suite, does offer CW as an operating mode. Personally, I have not tried that mode for either transmit or receive for an extensive length of time but looking at the mode very quickly as a station sends a CWID every few minutes the copy seems to be good.

Good luck in the search,

James KD5VXH

Ok, I just finished rewinding the last toroid and replacing the two switches above it since they wouldn't fit in the top properly. I then hooked up a 12v supply and a wattmeter and then a dummy load.
I got almost 6v on 40, 5.5 on 30 and 2.5 on 20. I tried to spread the wires out on the toroid but nothing changed. I power cycled the unit and then all of a sudden I got like 6v on 20. Power cycled again and back to 2.5v. What did i mess up?

I'd recommend checking the soldering on the 20 Meter output filter inductors. This problem has been reported in the Group several times. Also ensure that all the insulation is stripped from the ends of the wires before re-soldering.

Best of luck with the rest of the project.

Hello
In fact, I noticed that this is not the son distributed around the torus, which increases the power,
it is sometimes to bring them up for some of the turns, the two cores of the same pass filter there.

But it really depends on each lot, and there are a series of torroids not identical characteristics.
The rising power of a sudden it's strange, can warm up the welds on the low pass filter which is concerned?

I pulled the 20m toroids. I restripped them and then I resoldered L12 and 13. All power went down to about 1 watt on all the bands.
Resoldered in place and touched up the others and got 20 meters up to about 4 watts and the rest stayed at about 1 watt each. I will tear out the toroids tomorrow and clean the board up and then redo them all to see what the lottery has in store for me then.
Thanks for the help all.

good evening Ed
I do not remember, it's been too long
I think I missed a resistance effect, which I do not know, but there were many against capacitor charge.
Some ham radio, exchange of mails had wrote that the mica capacitors were more effective in the low-pass filters or other place ...
I do not know ...
One thing is certain, this pfr3 works perfectly well.

I havnt done anything with u11 the letters seem to be opposite of others i have looked at. However, the words are different, the #1 spot in upper left crnr as should be, new manufacture or batch im thinking. all tests have past with great results at this time. Low pass filter torroids a bit intimidating at first but went together without a hitch and taught, as all have recomended and leaned towards advisment I have no more need to want to glue.

I doubt that you need to re-wind the toroids. More likely a bad solder connection on one of them. That is usually caused by not properly preparing the leads by stripping -all- of the enamel insulation and tinning the leads properly.

Best of luck with the rest of the build.

From: Stan ae0sl
Topic: 3370 Message: 3370

I am looking for suggestions for headphones to use when I take my PFR-3 to the field. I have some Bose headphones that I love in the shack, but I am looking for something with good CW reproduction, but most importantly rugged construction that will survive backpacking through rough terrain. I do not want earbuds though. I prefer something over the ear.

Does anyone out there have a good suggestion for a rugged headphone?

3372. final test result and a question

Yahoo group: pfr3_group
Date: 2011-12-01 00:09:41 UTC
From: edingraham
Topic: 3322 Message: 3372

I performed the final tests today. The initial power output was 6/5/6 (on 40/30/20). After adjusting the low pass filter windings, I got 5/5/5 watts...so that's great!

Now for the question: I was wondering what the effect of adjusting the toroid windings was and why we are looking for 5 watts instead of 6. Please correct me if I am wrong: The low pass filters effectively convert a square wave to a sine wave. Apparently our designer, Steve, has determined that 5 watts corresponds to a clean sine wave, but 6 watts contains some pesky harmonic content.

It is time to bring out the good leather folks, and saddle up,
get ready to ride... it time for another FOXHUNT in the 40 acre woods once again.
There will be a Texas and a Wyoming Fox on the prowl... can you catch 'em and grab a pelt?
You can't say, if you've never done it. And... you can't say unless you do it tomorrow night.
7pm MT... or 0200z Friday.... Thursday nite in these here 40 acre woods.
Line up at 0200z, (7pm) somewhere between the two trees marked 7.030 and 7.050....
then look for the two FOXII on the loose... one will be barking out KZ5J and the other will be
barking WC7S... listen to them close... they will likely be telling you "up ....x" until after 0300z
and then work you simplex.... however... I must warn you... one of them is a sly fox... he might
bark "up 1" then be listening up 1.75 or even up 2.3... then up only .7... so spread out, and have a
lot of fun... if you all get into a pack.. and circle a single tree.. he will likely fool you all and jump
to another tree.... he's been known to do that.. so be very aware.

The Game Warden advises that anyone caught attempting to swipe a pelt after the horn blows at 0330z...
that's 830pm MT for you cowboy types.....will be severely punished about the ears and tail.... or ... just have
the pelt returned to it's rightful place.

NO BITING, and pulling tails... that won't work... play nice, is much more fun...
and speaking of fun??>>>>

IT's a GOOOOD Day for a FOXHUNT, FOLKS!!!!

Hello Ed,
My turn:) 5 watts or less is qrp for cw. i have nestled in at 6 watts with batteries that actually give 13 volts i belive after an hour of use batts will settle down to 12 volts giving me my 5 wts qrp. a regulated pwer supply is a solution but who wants to carry that? a mod using silicon diodes in line with + lead another. ive tuned to where you r and am settling in.

Stan,

I,m cheap so I use a Maxcell headphones "HP/NC-II". They are noise cancelling and work great. The price is around $35. The only problem is no volume control. The next step up is the "HP/NC-III" which has volume control. good luck

Ever have one of those days.. when it just doesn't seem to pay to get outta bed?
Well, this one was close... for me.

So.. after a shop computer crash, I reached for the back up thumb drives.. only to find... or more
accurately.. NOT find them.

So.. here's the question.. does anyone have the original PFR3 with the painted on labels, that has the
original cd? Could you send the manual from that cd to me, via email please?

Thank you very much.

3378. PCB holder you can build

Yahoo group: pfr3_group
Date: 2011-12-13 01:56:28 UTC
From: Ken
Topic: 3378 Message: 3378

Are you ready for a useful tool that you can assemble with a hammer? I came up with this after I got tired of chasing around pcb's on the bench top during construction and testing. I have one of those gimbaled pcb vises, but it takes up too much room on the bench.

This is perfect for secure holding of PCB's during soldering, prototyping, and testing. A dovetail
groove prevents any slipping of the board from the fixture, with minimal clamping pressure.
The jaw opening will easily accommodate and securely hold boards from 1/4" to 5", easily
extended with longer rods. The jaws are fabricated from UHMW, (ultra-high-molecular-weight
polyethylene), rods are Nylon. Easily replaceable elastic band for many years of service.
All the details are here for anyone wanting to build one, or there is a complete kit of machined
parts ready for assembly, now available.

The TACT switches the PFR3 uses are designed to be activated by sideways force, not so much of the straight up and down. Straight up and down forces will cause a premature switch failure. Yes, they activate that way, yet they are not designed for longevity in that use.

Oh yes, Ray
it's a shame, no photos ... I do not understand everything.
anyone know where you can buy nylon spacers and screw for a lot of Poly-varactor I have in stock?
The seller sold them with the two screws to fix them, but not the center screw that is not metric and without nylon spacers can be of various lengths.
(The longest is OK ... can be shortened) axis is connected, we can not put the metal, because the button is not isolated for HF, the setting changes when one puts his hand above, H . I.

Hello Dale
well I'm very surprised, I did not know this, because the smallest without a long stem is pushed right above normal.
So those are not the same products? ... Well I noticed it because I thought the same and to use this component as a miniature key
by moving the rod down on a small key to test ...
(It will not last long ... maybe not)
I just learned something I did not know, I probably misread the instructions ...

Topic: 3389 Message: 3389

Hola
I am new in the group.
Consider my self as a new Ham (for almost two years now) so still pretty green. Have been active in phone and digital. Learning CW and have a basic equipment setup that works and serves me well.

Just received my Hendricks PFR-3A, have finished assembling it and I am in the process of testing it.
Knew in advance, from Doug Hendricks, about the existence of this group.

All testing in the different sections is OK except for final testing: Got low power output, around 1 watt in 40 meters.
Found I had one extra turn in all my coils. Fixed that but still is too low: 2.4 watts at 12 Volts in 40 meters. All coil ends were properly stained before mounting and checked them with the multimeter to make sure good contact was made after soldering.

The amount of info found in this group is impressive and hope to find an answer for my problem.

Have always been interested in QRP and love to build kits.
Every day is a leaning experience in Ham radio.
Have a couple of kit videos in my YouTube channel. Spanish accent included:

Good evening Roberto
I think you're on the right road
the problem is almost always in the ferrite cores of low pass filters
position and distribution of turns is very important, it is not identical for all assemblies, the cores may have different characteristics.
if you are certain that the number of turns is correct, it can take the turns tighten them and bring up the torus and well look at the power meter output
and especially on a dummy load with 1 / 1 no return
It is not unusual to remove or add a turn if the result is good. 4,5 W or max. 5 W is good
Good luck, and congratulations of having arrived at the end of assembly.
My editing is here, if you look closely, sometimes it can help a bit

Jean (F6DDV), thank you for the pictures. I have gone through them in detail.

Those pics are so useful because I had a couple of doubts on how to properly assembly the PFR in the case at final stage. Your pictures clarified this. Thanks Jean.

Ren (KG4BAS) and Bob (AF2Q) yeap! Miniature Toys Steam Engines is my other passion.

I have more simple-low tech videos about them and a couple HAM Radio kit building ones too (like the TenTec 1254 Receiver and the Ed Cholakian's upgrade kit for the same too), in my YouTube channel. Look for Robertosala1 Youtube channel. I can grow old (46) and never mature :)

Some of those steam engines are very expensive but I have bought them in very very poor shape from eBay and restored them to their original glory. That is the only way I have been able to afford them. :-|

Regarding the problem with the output power of my PFR-3A... The test voltages in the U8-IC are correct (both un-keyed and also keyed according to the installation manual's pretests section).
The coils... Also checked mine with the ones that were clearly visible on Jean's pictures and are OK. The number of turns is correct. As mentioned in the introductory email, found I had one extra turn but fixed that last night.
I have spread all turns evenly around the coils. This time will do the opposite... will tight
them up and see what happens.

Will continue to look for assembly errors from Group 4 and up too.
Thanks for your comments and the welcome guys.

Good evening Roberto
I
think you're on the
right road
the problem is almost always in the ferrite cores of low pass filters
position and distribution of turns is very important, it is not identical for all assemblies, the cores may have different characteristics.
if you are certain that the number of turns is correct, it can take the turns tighten them

and bring up the torus and well look at the power meter output
and especially on a dummy load with 1 / 1 no return
It is not unusual to remove or add a turn if the result is good. 4,5 W or max. 5 W is good
Good luck, and congratulations of having arrived at the end of assembly.
My editing is here, if you look closely, sometimes it can help a bit

Hello Yasutaka
No doubt that some friends will not agree, but I think a dummy load and a power meter are sufficient, and adjusting the oscillator frequency
and other settings can wait or be a receiver, which is rule on an issue of WWV or other frequency 10 MHz it is quite accurate as it comes,
we can wait a bit, it's not very annoying at first.
Have fun and take your time with this arrangement.

Hi all,

I am wondering what tools are required/recommended to build prf-3. I have good solider iron and other basic tools. Wondering if we need to have watts meter, marker/signal generator or any other tools for build/tune the radio?

Hello again Roberto
I am pleased to have been useful, and I know that I also tried a few photos hanging assembly of the kit,
so I thought it was useful to take pictures, too, there are always small things that do not qualify as a kit,
because nobody built the same way, the kit is very well done by Hendricks, and a lot of ham radio
are very happy with this little yellow box.
Small steam is also quite extra ordinary H. I.
It's almost "magical" ...

But tell me, Roberto, your QTH locator, it is not
EKCC instead of SKCC?

Hi Jean.
My square is EK53, ITU 11, CQ Zone 7.

SKCC 8404 is my ID con el Straight Key Century Club (I have it as default in my CMOS to write it down ;)).

Just an update of my PFR-3A assembly. Last night I tried by not spreading the coils but tighten them up but output power decreased instead of increasing (this was expected as mentioned in the manual)... so looks like my problem is somewhere else.

Will have more time during the weekend to find the cause of so low RF output.

Un abrazo from San Salvador.

Hello Yasutaka,

I would say that, other than basic tools and a soldering iron, all is required is a DMM of which the accuracy can be trusted, a 50 Ohm 5 Watt (or more) terminator and a properly calibrated RF probe.

A sig. gen., Watt meter and frequency counter would be also be quite useful but not necessary.

Hi group,

I got my kit after 10 days of ordering it. Paid about 47 EUR for customs and tax.

Yesterday I checked the components and all are present. Some have even an additional part...

So after the Christmas stress the work can beginn in 2012..
Merry Christmas and a Happy new year to all "Groupies"

From: Roberto
Topic: 3404 Message: 3404

Finally is working.
After reviewing and revising every thing step by step, power output continued to be very low. Around 2 Watts.
Decided to try with my big power supply, the one I use for my main rig, and old and trusty Kenwood TS-690S and the PFR now works fine. At 13.8 volts, its output power is a little more than 5 watts.
Will add a couple of diodes as mentioned in the manual to reduce power to 5 Watts. :)

Before, I was testing with my small power supply, the one I use for my TenTec 1254 receiver. It is supposed to be 1.5 Amps. At 12V when transmitting with the PFR-3A, the voltage dropped to 9 volts!

Just finished putting all decals and drying now.
Steps ahead, two light coats of clear lacquer, final assembly in the case. Will add a fuse for protection.

Any suggestions for additional mods? before I finish... will be greatly appreciated.

Thanks to all who helped.

Hi Andy,

My kit arrived a few weeks ago into Czech Republic. Lots of bureaucracy to get it out of customs,and like you, VAT duty was payable.

I will also be starting my build after the Christmas festivities. Maybe we can compare notes as we proceed?

How cool would it be to build up the kits and make first QSOs with them yellow to yellow?

Have a good Christmas, and hope to get on air at the same time as you in 2012

3407. BLT Question

Yahoo group: pfr3_group
Date: 2011-12-19 23:50:15 UTC
From: k6mgo@verizon.net
Topic: 3407 Message: 3407

I have a 50 foot dublet center fed with a very short piece of 300 ohm twin lead, less than 4 feet. The antenna is indoors.

I can get a good tune on 40 and 30 meters, but, on 20 meters, both the Tune and Load caps are just about max clockwise, and the LED just starts to dim, like it wants to go more clockwise.

Can anyone tell me if that is at max or min capacity for these capacitors, and I've tried to tune the trimmers on the back of the Tune control from full mesh to half mess, yet it doesn't seem to make any difference.

Anyone have any suggestions?

3408. Re: [pfr3_group] BLT Question

From: Bill Adams
Topic: 3407 Message: 3408

Try adding a short extension to the twin lead. That will transform the impedance presented to your PFR-3 and you'll have to start over tuning all bands, but at some point(s)all 3 bands will be within range of the BLT. Let us know the results, as I too find the match point at the extreme end of rotation for one or both capacitors.

Andy

I just finished mine today.
It is all closed, and is giving good output.
I am using a small UPS 12v/7Amps Battery and also the internal AA batteries (which, even though they are alkaline new, produce lower output).

I am trying to test it by having a QSO but in my country and Central America, we do not have many CW active hams.

Easier in EU and north America where you have a lot of active CW hams that can easily pick your QRP signal.

Will post the pics soon.

Merry Christmas to you all and hear you soon.

ref:
http://www.reversebeacon.net/dxsd1/dxsd1.php?f=0&c=ys1rs&t=dx

If you haven't tried the reverse beacon, it will be a fun experience:
www.reversebeacon.net

One thing you can do, is search by call sign. And so if you enter your call sign you can see if the skimmers are hearing your signal in real time. Use the filter on this page, search by call sign and enter your call when you are calling CQ. Very cool / useful for propagation studies.
http://www.reversebeacon.net/main.php

By the way; when I lived in South Africa I made a W8JK wire array. It allowed many QSOs with USA. It is inexpensive and fairly easy to get high enough to have good pattern on 20m. Of course there are many other options for HF fixed directive antennas that are economical to construct and that should be another fun project! Please let me know if you want info on that antenna.

Andy

I just finished mine today.
It is all closed, and is giving good output.
I am using a small UPS 12v/7Amps Battery and also the internal AA batteries (which, even though they are alkaline new, produce lower output).

I am trying to test it by having a QSO but in my country and Central America, we do not have many CW active hams.

Easier in EU and north America where you have a lot of active CW hams that can easily pick your QRP signal.

Will post the pics soon.

Merry Christmas to you all and hear you soon.

Hi Andy,

My kit arrived a few weeks ago into Czech Republic. Lots of bureaucracy to get it out of customs,and like you, VAT duty was payable.

I will also be starting my build after the Christmas festivities. Maybe we can compare notes as we proceed?

How cool would it be to build up the kits and make first QSOs with them yellow to yellow?

Have a good Christmas, and hope to get on air at the same time as you in 2012

Yes Lynn.

I was testing the PFR-3A last night.
Finally got 5 watts on 40 meters.
I have not tried the tuner though.
Still do not know if it works. Need to build an antenna to try.
My antennas are all well tuned :(

Any idea how can do a fast test and see if it is working?

I need to build a travel wire antenna. Something that could be rolled down from an hotel window...hihi.

Will do some further testing on the reverse beacon in a few minutes.

From: k6mgo@verizon.net
Topic: 3407 Message: 3412

I guess I could try that Bill, but I would rather figure out why the BLT is so touchy for me. I've had little success with it outside, with long wires of 50-55 feet, and 28 feet, and now with a balanced antenna, of 50 feet. I usually can get one or two bands to tune, but, not all three, on any one antenna. I'm trying to find out if it's my technique, or the tuner. Using my old ZM-2, I can match just about anything. So I was trying to extend the range of the BLT Load cap, as it was at the max clockwise position on 20 meters and just started to dim to about 50% when it runs out of movement. That's why I was asking about the trimmers on the back of the tuning cap.

It is very tuning "sensitive". I've practiced with resistor loads on the output and over the holidays hope to make a systematic evaluation of tuning into loads ranging from 10 to 4000 ohms. Hopefully that will improve my skill in more quickly finding a match as well as defining the range of the BLT tuner in my radio. I find on real antennas that I more quickly find the match combination by peaking the tune capacitor on noise before performing the keydown tune.

I never did figure out the trimmer positions so I just left them as specified in the build instructions.

3414. Re: [pfr3_group] Re: BLT Question

Yahoo group: pfr3_group
Date: 2011-12-20 18:40:38 UTC
From: Steven Weber
Topic: 3407 Message: 3414

The trimmer caps have little range, so they have little effect. How you wind the toroid (wires tight to the core or loose and how they are spread) will have a much greater effect.

Full clockwise is minimum capacitance. If the Tune capactior is also at or near full clockwise, that would indicate there is too much inductance and you need to spread the turns on the toriod out a bit.

Tune and Load are interactive. Ideally, strive for the highest amount of load capacitance and the least tune capacitance. The BLT is a tuned circuit, which is why it is touchy and the adjustment very sharp. Both Tune and Load affect the resonance, which is why they are interactive.

Steve KD1JV

I agree that it is sensitive, but, I'm used to that with the ZM-2 and also got a note from Steven telling me to tune the "Tune" control first for max noise in receiver then adjust the "Load" control for dimming of the LED. Still can't get it out completely on all bands with all antennas.

I'll be very interested in your findings as to the tuning range of the BLT, Bill, please let us know what you find.

Tnx & 73

From: k6mgo@verizon.net
Topic: 3407 Message: 3417

Took your advice and opened the case and tried to spread the turns on the toroid, Steve, but, I guess I had wound it pretty tight, because I didn't have much leeway. Did get a little more spacing, but, 20m tuning was still up against the stop, at max. CW of the Tune Control. So, went in again and adjusted the trimmers (both) on the Tune Control, for min. capacity. Now, 20m tunes completely dark LED with Tune about 10-20 degs off of max. CW, and the other two bands, tune in the middle of Tune Control's range. So, I'm going to leave it like that, as I don't want to break anything, now that I have it working nicely.

Thanks for your help,

73, Bill

3421. Second batch of printed circuit board holder kits

Yahoo group: pfr3_group
Date: 2011-12-25 21:50:55 UTC
From: Ken
Topic: 3421 Message: 3421

On to the second batch of board holders kits... I came up with this after I got tired of chasing around pcb's on the bench top during construction and testing. I have one of those gimbaled pcb vises, but it takes up too much room on the bench.

This is perfect for secure holding of PCB's during soldering, prototyping, and testing. A dovetail groove prevents any slipping of the board from the fixture, with minimal clamping pressure. The jaw opening will easily accommodate and securely hold boards from 1/4" to 5", easily extended with longer rods. The jaws are fabricated from UHMW, (ultra-high-molecular-weight polyethylene), rods are Nylon. Easily replaceable elastic band for many years of service.

All the details are here for anyone wanting to build one, or there is a complete kit of machined parts ready for assembly.

Hi Rob,

Sidetone is generated by the microprocessor at pin 26. To the best of my knowledge, there is no means of changing the frequency other than modification of the firmware.

Yes, I understand Steve.
No problem. Is just that I was used to the 800 hz of my Kenwood.
The BFO is adjusted against the 600 hz.in the PFR-3A so I get a good reference for zero beat.
Was just wondering if there was a way to adjust it to your likeness.

But again... those features would have increased the price of the rig.
Its low price is one of the biggest pros this nice little box has got.
600 hz is a pleasant tone though.

Well, the trouble is in the way it works. There are a limited number of timer/counters in the MAGA48 processor to use. One timer is used to generate the side tone, the timing for the keyer and the display mulitplexing. This counter is set to produce interupts every 833 us ~1200 Hz. When divided by 2, produces the 600 Hz sidetone. Since this clock also times the dot/dashes, if the sidetone freq were to be adjustable, the constants used for each keyer speed would have to be calculated on the fly for that given sidetone frequency and desired keyer speed instead of the simple look up table used now.

So while in theory, it would be possible to have an adjustable side tone frequency, in practice writting the routine to do that gets a bit complicated, so I didn't do it. I belive a copy of the PFR-3A source code is in the files section of the group, so if anyone wants to take a shot at adding an adjustable side tone feature to the code, have at it!

The only thing which would affect the cost would be if there isn't enough program memory left to add that feature (and there might not be) so a processor a larger memory would have to be used.

I see! The way it is now is just perfect.
It generates/calculates the tone is an easy, simpler and trouble free way.
Less load on the processor too. Otherwise a complicated routine would make thinks slower and could screw up everything.

Thanks for the detailed explanation.
I was just curious. Have learned more about this rig today.
Thanks to Dale (WC7S), Steve (WB6TNL) and now you, the designer, for responding.
Glad to know I am not alone at all.

General question:
...I wonder if there are more PFR-3A users in Central America but do not know of their existence as of today yet...
...I know there is one, far away down there, in Argentina (LU4DQQ). In western Europe, PFR-3A is popular.

Thank you guys.

Topic: 3427 Message: 3427

Guys, I bought the PFR-3A to be used when traveling.
Do you know of an acceptable hotel antenna? By this I mean something that could be rolled down through the window (no counterpoise available).
In this part of the world, all buildings are made of concrete and steel so an attic antenna wouldn't work at all.

Sounds silly but... any ideas?

If nothing like that is found... the second choice would be something easy, not messy, to put out on the hotel garden. Easy to carry in your luggage,will look nice (so hotel personnel would not worry about mess with wires all over) that could be assembled fast and ease to put away.
I guess a vertical could fit easily here, but I am not expert in the field of backpacking and do not want to invent the wheel again.

Any suggestions please?

Rob.

I don't know about hotel window antennas but one I have used for portable work which is easy to set up in a small space and matches the PFR3's bands is WA3WSJ's Black Widow vertical. I have even set it up in a compromised way on a second floor balcony and it has performed well. It sets up in 5 minutes and doubles as a hiking stick. 73 Jerry WA3WSJ's Place <http://wa3wsj.homestead.com/>

I like an end-fed Zepp antenna for hotel use and for use in parks with it thrown into the trees. I love the Par End-Fedz 20m antenna. It is a commercially available, well built antenna that loads up well on one band with the PFR-3.

65 feet of wire about say $1.50
Plastic box made from a burnt out wallwart $00.00
1 poly cap $2.00
1 T-68-2 core .75 cents
New connectors from Radio Shack about $4,00.
Tiny hyper bright white LED and a couple resistors about $2.50
Build the tuner and save some big money,
The Par is good but I found that each location need me to adjust the
antenna wire.

Hello
I did not know the antenna placed on the grass ....
it is quite extra ordinary
thank you

Hello
Hmm ... if the hotel to a park and trees available and the "boss" is in agreement, okay, H. I.
But otherwise, there is the magnetic loop to save you the radio silence ...
I tried two antenna inside YoYo shaped "V" with the T1 box
I made a dozen QSOs in the evening ...

3433. Pretest before installing L7 in Group 3

Yahoo group: pfr3_group
Date: 2011-12-29 12:56:37 UTC
From: Yasuyuki Tanaka
Topic: 3433 Message: 3433

Hello everyone,

I am now confusing in the preset before installing L7 in Group 3.
When I checked the voltage (to ground) on the L7 pad to the right, next to C57,
it showed 7.78V under supply voltage was 8.98V.
While the manual said that the voltage should be about the same as the supply voltage,
how much it should be accurate?
Is my measured value within the range for going to the L7 installation?
So far, I could not find any problem about connection and value of R34 and R35, but
I do not know what I should check Q5 (so far, soldering looks all right.).
Under such situation, the voltage test (to ground) on pins 1 and 13 of U8 was OK when the key was on and off.
I will appreciate any warm advice.

Regards,

Yas (7n4rho)

Hello Yas,
I'd proceed at that point. I usually see just a bit more voltage there, or rather closer to the supply. But you are well within the ballpark of being ok.
When you reconnect power after installing L7, be watching the current flow from the supply, especially during the first key up time.
Good Luck, sounds like a good build is occurring,
Have a great day,

Thank you very much for warm advices.
I could find the solution by myself after several checking.
It was simple mistake that I did not go into the straight key mode.
Once I went into the straight key mode, the voltage on the L7 pad became 8.69V
under supplying 8.89V, which seems to be OK.
After that, I have just completed till Group 4 today and will go on to the Group 5
tomorrow.
Please excuse me but bothering you by such a small mistake.
Appreciate your quick and kind advices.

Best regards,

Yas (7n4rho)

We should pick a time and freq. and contact other PFR-3 builders. First time on the bands made contact w / St. Louis, S. Carolina and Juarez Mexico it was snowing and i just tossed the LAMBDA wire as high as possible in a tree, counter poise abt 1 foot off the snow sitting at my kitchen table in front of the fire place. What a nice rig the building was a great experience. Happy New Year all.

This one is cheap to build (money is a big issue) but here in my country you can find all components but not the poly cap neither the core. Those two components are too specialized to be available locally.

Where can I buy those in the USA and get them by mail?

Rob,
You can't use the tuner in the pfr3 rig?
Works fine on mine but you have to flip the switch on the back.
If you need a couple T68-2 cores and a nice heavy duty cap I can send you those with no problem

Hi Bob.
Thanks for the kind offer. I am thankful but I was confused.
Read the list of components you posted and I followed the link for the end fed long wire you suggested and being a newbie... I thought I needed all those components to build the antenna.
Now I see! : All I need is the long wire. The tuner is already in the PFR-3A (I thought I needed to build the other tuner to make the antenna fit into the limits/range of the PFR-3A tuner (which I thought were very narrow).

Space limitation in my country is a problem. The antenna I intend to build is to be used when traveling, from a hotel window with the PFR-3A.
This one is perfect to be used on a field trip or from the hotel big green areas, to be thrown on the trees. I will build this one and keep it ready at hand.

Other option is the Magnetic Loop but I believe efficiency is a problem as I only have 5 watts. I need 15 to 25 watts to come close to what a dipole at 5 watts will do. Again, I may be wrong on this too.

The black widow vertical sounds to be the most versatile option. Small footprint but the site shows the coil portion well but no details about the grounding wires or the vertical radiator is shown leaving a lot in the dark (from a newbie point of view).

Rob Your on our list but it seems you have not read everything or watched the videos on the mag loop. The mag loop will work much better then the average dipole unless you can get that dipole at lest 35 feet up and in the clear from a hotel room you can just hang it on the wall. Make it from coax and then you can fold it up. I worked Japan with 50 watts (JA2HRO) and Sudan with 5 watts,Cuba with 5 watts. You call so I can't do much if you have no faith in the Loop Bob AF2Q

Wow! Bob that is a good performance!
Will read more and get deep into it.
In this case will need variables not available locally but easy to find on the net, as all models I've seen seems to require them and that was discouraging me a little.
I just saw one that will tune all 3 PFR's bands that will require 3 trimmers 5-50 pF. Here http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=10223

I guess the trimmers won't need to be big as the pfr is only 5 watts.

Lots of info to read.

Rob,
Your on our list.
Look at the calculators.
A three foot MAG LOOP (3 foot in diameter) and 1 tuning cap is all you need.
I have to leave now but the calculators are in the links section near the bottom
A 3 foot diameter loop and a cap rated at 30 to say 365 pf will get you the 3 bands
I never had luck with that delta shape wire antenna and it is not a true mag loop.

Hi Bob.

Sorry about that. Now I understand what you mean with "Your on our list".
I am used to use forums, which I think are better, but not Yahoo Groups.
Yahoo Groups use this email replicator system that is more convenient to members than to use forums but I am not used to it.
Any way... I have this question that many green members looking to build its own Magnetic Loop will ask:

I have the calculator. There are so many different designs.
Would you recommend an specific one?
an specific page/site of the many I could find a solid design so I can stick to that one and get deep into it? Octagonal, square or circle?

Also the variable capacitor for the range of between 14 and 200 pf (1 kV) is needed for a 3 foot diameter.

Those are not found locally. Could you recommend an affordable not too expensive one?
Sorry for so many questions but so many variables to choose from too.

Rob

3446. Final test (Power output)

Yahoo group: pfr3_group
Date: 2012-01-02 14:18:27 UTC
From: ptanaka_9v1by
Topic: 3446 Message: 3446

Hello, I wish everyone have A Happy New Year.
I had completed group 5 and checked the power output, but could not satisfy the result because its value is 4.0W@40m, 4.5W@30m, 5.1W@20m under supply voltage 12V.
Checking L8, it looks not bad about the number of turns and the evenness of each turns (I hope). Are there any other check points for solving lower output power? Or, do I have to accept my result as QRP transceiver?
Any kind advice will be appreciated.

Best regards,

Yas (7n4rho)

Happy New Year to all

I'm just getting around to finishing off my pfr3. I'm not getting the rated power out. I'm getting 3.5 watts out on 40 and 2 watts out on 30 and 20. Counted turns on L8 L10 L12 spaced turns out as evenly as possible. I'm using a regulated 12V power supply. Any suggestions?

Tom,I didn't build mine but I built most of what a local ham has. Had the same problem as you but all you have to do is peak and tweak the coils. As you know each band has it's own final so just keep tweaking. I get 5+ watts with fresh energizer batteries. My friends rig only had 2 watts on 40 and just over 3 watts on the other bands Go over the manual again and check to see if you get a big power drop if your using a battery. Keep us posted Bob AF2Q

The tx power out is affected by the coils L8 through L13... given that the tx is feeding a 50 ohm dummy load, and being fed a pure 12v (9v preferred) 2 - 3 amp capable supply, it should produce the published 5 watts easily. Some minor adjustment may be made, if a careful eye is kept on the current and output. However, quite often the problem isn't the tx.. but rather either the dummy load... or the supply... and I am referring to the dc available, key down, at the input to L7,
thus eliminating the possible connection issues. If the voltage going into L7 drops.. say to 9 v, key down, but the input to the case is 12.. or from the battery carrier.. then the issue is "supply" connections.
Good Luck,

Hello Tom
and good morning
I built this pfr3, and I can simply say, do not worry, this story is the same for almost all the guys.
Everything happens in the two cores of low pass filters for each band, do not touch anything for 12 volt you can get up to 7 + W, almost 8 ...
But as written, should not exceed 5 W, and not exceed 12 volts
You have to take your time
We must check with a magnifying glass if you just counted the towers (each time the thread enters the circles of the torus is a spiral,
as the wire is above and below> 1 turn + 1 / 2) if it is not good must be removed or added.
If you are on this, we must try to move turns up on one or both cores of each band, and monitor the power meter ... and you will see good results quickly.
Good luck, I think other guys will tell you about the same.
The pictures of my pfr3 and photos of other ham radio are on the site, looking good, we see that some have moved the turns.

Hi to all

I redid the test connections to the dummy load and retested the power outputs. 5 watts on 4o and 20 4 watts on 30. 30 does not seem to be responding to tweaking the coils. I looked at the coils on 30 L10 and they seem to be a little loose on the core I wonder if this could have an effect on the power output on 30.

Tom,
I wind them tight but then it is hard to spread the turns.
But you only have to move them a hair and it will change the power you see.
Maybe your dummy load is heating up so let it cool down.
Put your finger on the one core and see how much the uH will change if you
have a meter if not then you should see the power drop or go up.

Yas-san

I think 4.5W is short a little..
My PFR-3 is 5w at 40m, 5.5W at 30m and 6W at 20m by KURANISHI WD-201 watt meter.

Please check L9. L8 and L9 are 40m.
Basically our advice are,
1. Recoil
2. Re-solder
3. Re-measurement
Recoil, that coils are too small, we can not find any problem by eye, but recoiling is just a one way.
Re-solder, it is difficult to remove an enamel coat, please carefully remove it.
Re-measurement, someone use high power watt meter, so it can not show precisely.

I know your work are perfect, but that is just check point.

Have a nice day and sorry in poor English.

In my case, tried everything with no luck.The problem was the power supply.
It is rated 1.5 amps/12 Vdc but it was not providing enough. When transmitting the voltage drop to 8-9 Vdc.
As soon as I tested using my main rig's big power supply (13.8 volts), I found the opposite. It was giving 7 watts in all bands.
Had to adjust the coils to drop down to 5 watts.

Rob.

Rob,
With regard to running the PFR-3A using a 13.8v power supply, the instruction manual tells you to put two silicon rectifier diodes in series with the power supply when using this high voltage. This will limit the supply voltage to about 12.6v which should provide good lifetime for the finals. I don't think you get that same safety when adjusting the filter coils to reduce OUTPUT power using 13.8v. I use the diodes and run my PFR-3A from my computer UPS battery system (13.8v).

73,
Peter - KB1PBA

Hi Andy,

I've almost finished building my PFR 3a.

One small oversight in instructions is that R48 appears to have been replaced with a 1 k ohm resistor. I spent ages trying to figure this out but a search for <<R48>>> on the messages in this group provided the answer.

Hope your build goes OKand hope to hear you on air sometime soon.

IF you adjusted the toroids with an eye on the current during keying and adjusting, and the power out, you have arrived at the best tuning.
It really isn't advisable to adjust the finals either the toroids or an antenna tuner, with the input voltage that high. A pair of diodes, or a 5 ohm resistor (2 watt) will help drop the voltage to a better level. Better because it forces less current through the finals, and thus saves loosing the magic smoke.
Have a great new Year!!

Good morning everyone,
Thank you for your kind advice, Rob and INK-san,
I use my main rig's power supply adjusting its output voltage 12V from 13.8V, but it didn't get better.
(Checking various supply voltage, it is found that the output power in 40m became 5.0W when one in 20m became 6.5W at supply voltage 13.63V.)
I think supply voltage is not the reason.
In the next step, I tried to peak and tweak L8 and L9 as much as possible, but nothing has changed.
Then, I removed L8 and L9, checked wiring (wind the wire snug to the coil as much as I could), and then reinstalled, but again nothing has changed.
Finally, I reduce one turn in L9 (became 18 turns from original 19 turns), but it got worse that the output power in 40m dropped to 3.0W!! from 4.0W, though the manual says "Having just one extra turn will reduce power output.
Bad thing is that I cut off the wire accidentally and no more #28 wire with this kit.
Here is a question, is there any problem if I use #30 wire instead of #28 for re-winding L9?
And if anyone have any idea or advice, I will be happy to hear that.
If not, I may have to accept the current situation and go on to the next stage (mounting) after rewinding L9.
Will appreciate any kind help.
Thank you in advance.

Best regards,

Yas (7n4rho)

You may find that putting 20 turns on L9 may provide better tuning for you.. keep the same core. Yes you may use a different size wire...
if you can get 20 turns of #26 wire, that would work.. and yes, #30 will work too... although I like to go larger if it fits on the core.
Good Luck,

oh.. can I send some #28 to you? Tell me your address, if you'd like?

Subject: Re: [pfr3_group] Final test (Power output)

Good morning everyone,Thank you for your kind advice, Rob and INK-san,I use my main rig's power supply adjusting its output voltage 12V from 13.8V, but it didn't get better.(Checking various supply voltage, it is found that the output power in 40m became 5.0W when one in 20m became 6.5W at supply voltage 13.63V.)I think supply voltage is not the reason.In the next step, I tried to peak and tweak L8 and L9 as much as possible, but nothing has changed.Then, I removed L8 and L9, checked wiring (wind the wire snug to the coil as much as I could), and then reinstalled, but again nothing has changed.Finally, I reduce one turn in L9 (became 18 turns from original 19 turns), but it got worse that the output power in 40m dropped to 3.0W!!
from 4.0W, though the manual says "Having just one extra turn will reduce power output. Bad thing is that I cut off the wire accidentally and no more #28 wire with this kit.Here is a question, is there any problem if I use #30 wire instead of #28 for re-winding L9?And if anyone have any idea or advice, I will be happy to hear that.If not, I may have to accept the current situation and go on to the next stage (mounting) after rewinding L9.Will appreciate any kind help.Thank you in advance.
Best regards,
Yas (7n4rho)

Subject: Re: [pfr3_group] Final test (Power output)

In my case, tried everything with no luck. The problem was the power supply. It is rated 1.5 amps/12 Vdc but it was not providing enough. When transmitting the voltage drop to 8-9 Vdc.As soon as I tested using my main rig's big power supply (13.8 volts), I found the opposite. It was giving 7 watts in all bands.Had to adjust the coils to drop down to 5 watts.

Yas-san

I think 4.5W is short a little..

My PFR-3 is 5w at 40m, 5.5W at 30m and 6W at 20m by KURANISHI WD-201 watt meter.

Please check L9. L8 and L9 are 40m.

Basically our advice are,

1. Recoil

2. Re-solder

3. Re-measurement

Recoil, that coils are too small, we can not find any problem by eye, but recoiling is just a one way.

Re-solder, it is difficult to remove an enamel coat, please carefully remove it.

Re-measurement, someone use high power watt meter, so it can not show precisely.

I know your work are perfect, but that is just check point.

Have a nice day and sorry in poor English.

Kumekazu INOUE “INK”

On 12.1.2 11:18 PM, "ptanaka_9v1by" <ptanaka_9v1by@...> wrote:

Hello, I wish everyone have A Happy New Year.

I had completed group 5 and checked the power output, but could not satisfy the result because its value is 4.0W@40m, 4.5W@30m, 5.1W@20m under supply voltage 12V.

Checking L8, it looks not bad about the number of turns and the evenness of each turns (I hope). Are there any other check points for solving lower output power? Or, do I have to accept my result as QRP transceiver?

Any kind advice will be appreciated.

Best regards,

Yas (7n4rho)

Yes, I know. The power supply was mentioned because that is how I found my problem was the small adjustable power supply.
I use my PFR with a 7A small 12V UPS battery.

Rob,
With regard to running the PFR-3A using a 13.8v power supply, the instruction manual tells you to put two silicon rectifier diodes in series with the power supply when using this high voltage. This will limit the supply voltage to about 12.6v which should provide good lifetime for the finals. I don't think you get that same safety when adjusting the filter coils to reduce OUTPUT power using 13.8v. I use the diodes and run my PFR-3A from my computer UPS battery system (13.8v).

Hello Yasuyuki
It's not luck, it will be good to add a tour and more, I read that sometimes powdered iron cores
may have slightly different characteristics.
for you, I will continue editing, and maybe you will find almost the same enameled wire in coils
of old radio transformers, any enamelled wire with a diameter close enough will be fine I think.
With a caliper you'll find it.
Good luck, as you are finished editing and exceeded all the problems, you learn things and more!

Hi all
Regarding the 13.8 volts, it is important to remember the two diodes in fact, for my part I put cell Li-Ion batteries inside
(3 cell 2800 mA / h) and a switch inverter to choose, or the load or external power from the input volts Jacq.
I never managed to empty the three cell battery pack that I built from a computer battery, which was partly defective,
this solution is interesting and free ... The photos are on the web site
The 3 BS170 not afraid to go out too 7 W CW fast.
I saw 8 W on mine before I take the necessary low pass filters on ... transistors are not grilled on dummy load 50 ohm 1 / 1.
but as they would be 13.8 volts is not with more volts, return HF, I think it would be fatal over 2 ROS;

Greetings,
I just found a "No Counterpoise Antenna System" antenna; it's just 50 ft. of lamp cord with one wire cut at the 25 ft. point; the 50 ft. wire is the "red" stub and the 25 ft. wire, the black stub. I suppose this is sort of an end fed Zepp. Here's my question, should the BLT on the pfr-3 be configured for a balance line, or end fed antenna?

Ot goes direct to the rig since it has a tuner so use it as a balanced line.

I'd recommend trying "balanced" first. If that doesn't work then switch to end-fed.

That configuration is simply a random-length wire end-fed with a random-length feedline. The trick is that it is non-resonant on the bands of interest which should bring the impedance at the rig end of the feedline within the transformation range of typical ham antenna tuning units. If you have an RF impedance bridge or antenna analyser then you can determine what the actual impedance is on the band(s) of interest.

I'd recommend trying "balanced" first. If that doesn't work then switch to end-fed. You may also need to employ an RF return wire.

FWIW, a "Zepp" is always a half-wave antenna fed with an odd-mutliple of quarter-wavelength line. Anything else is not a "Zepp".

Best of luck with the project and let us know how it works out for you.

yes this antenna is an EFZ (end fed zep) and was featured on www.WA0ITP.com website, is specifies that a BLT Tuners was used when he was using it. or that you could use a Balanced line tuners of your choice.
The BLT (now the BLT+) is available on www.qrpkits.com

Good evening gentlemen,

Appreciate all of your warm advice.
Dale, you are right. I wound 20 turns on L9 with remaining #30 wire and got 4.8W under supply voltage 12.05V.
Experimentally, I tried 21 turns, then got 5.8W.
Based on this result, I checked L11 for 30m band where I only got 4.5W. I removed L11, make it one turn less, meaning 14 turns (original 15 turns),
resulting the power output was reduced to 3.5W from 4.5W under supply voltage 12.05V.
This mean L11 coil also has same characteristic as L9. I believe 30m band also will be improved to around 5.5W if I wind 16 turns on L11 (never try). Now I need to choose the best way for 30m band, current situation (4.5W by 15T) or pushing up the power output (5.5W by 16T).

Regarding the lost #28 wire, thank you very much for your warm proposal, Dale.
But, it is OK because here is too far from your location and I will be able to buy it in Akihabara town in Tokyo, very famous and large shopping area for any electrical products from small parts to large gear including Ham radio (Of course!!).

Again, let me say thank you very very much, gentlemen.

Kind regards,

Good evening Yas,
If I were to choose, I'd add the turn to 30, to get the power up as much as possible, on all the bands...
Then reduce the supply voltage, to drop the power out, to your chosen level... thus reducing the final current,
and insuring longevity to the finals.
I run mine most of the time on 9v or less.
Have a great time with it,

It is not a Zepp.

Even Terry WA0ITP states that in his article: "As is common knowledge, a true End Fed Zepp is a half wave radiator and a quarter wave balanced feedline."

He also states that "The No Counterpoise is a neat version of our old friend, the End Fed Zepp.." I don't agree with this either. If the radiator was twice the length of the feedline then it would be a version of the Zepp. It would be a true Zepp on 9.4 MHz.

The point I'm trying to make is that a Zepp has a specific description. Just because any antenna is end-fed with "balanced" line does not necessarily make it a Zepp.

In a weak attempt to keep this on topic, a Zepp would work fine on a PFR3. Since the impedance at the transmitter end would be near 50 Ohms, the PFR's built-in tuner would easily handle it and also make the transition from unbalanced to balanced feed.

Just hook a wire to it,lay out 1 counterpoise wire and tune it and make
some contacts

sigcom@... writes:

Even Terry WA0ITP states that in his article: "As is common knowledge, a
true End Fed Zepp is a half wave radiator and a quarter wave balanced
feedline."

He also states that "The No Counterpoise is a neat version of our old
friend, the End Fed Zepp.." I don't agree with this either. If the radiator was
twice the length of the feedline then it would be a version of the Zepp.
It would be a true Zepp on 9.4 MHz.

I agree. That's where a wire non-resonant on any of the bands of interest (40-30-20) comes in real handy. Yes, it requires an RF return wire but it is multi-band and the impedance will usually end up being within the built-in (BLT) tuner's adjustment range to transform to 50 Ohms. Plus it doesn't require a feedline. Erect it in almost any configuration, Sloper, V, Inv. L, Vertical, etc., screw it down to the binding posts, adjust the tuner and go to town.

Use a tank circuit (LC circuit). Use a variable capacitor and find resonance then it's a simple matter to calculate the inductance once you measure the capacitance.

DRG,

Great question! Here are a few portable antennas for PFR-3A that have worked for me:

1) Center-fed 50' horizontal doublet I used was simple, and it included MUCH more feed-line than I needed: I used 2 x 75 pc of insulated wire. Taped the wires together every foot or so to make a loose parallel wire feed line 50 ft long, and 2 x 25 ft legs to make the 50 ft doublet. The antenna can be either "horizontal", or in an "inverted-vee" if you like.

2) "Lambda" antenna, which is just an off-center-fed 34 feet on one side and 15 feet on the other side with a simple parallel wire feeder 10 ft long. This can be installed in a number of positions, but I used it in a "sloping" position. (Drawing of this antenna is on a YouTube video called ... "Lambda Antenna" *.)

3) One of the first portable antennas I used was a 34 ft insulated end fed wire (as vertical as possible) with 15 ft insulated counterpoise laying on the ground.

There is a video of each of these three antennas on www.YouTube.com/NG9D . And the internal tuner in the PFR will tune all three of these antennas on 40/30/20m. The tuner in some cases is very touchy and you may feel a bit like a "safe-cracker"!

4) Out of curiosity, I also used the 34 ft wire with no counterpoise and it also worked OK, but didn't make a video of that ... yet ;-)

I am not an expert, but in my opinion I think in terms of simplicity (light weight, small package) and effective performance (low angle radiation especially on 20m) I would say the 34 ft end fed wire positioned as vertical as possible with 15 ft counterpoise laying on the ground would be a good antenna to start with. Some may say longer wires are better, but for me in many temporary locations it is hard to get much more wire in a vertical or clear position and 34 ft is an easy length to work with.

Conversion factor -- divide by 3.281 to get length in meters. Also, the ARRL Antenna Book is a wonderful resource.

* PS - the Greek letter "Lambda" is often used in math formulas to represent one wavelength. But in the case of my "Lambda" antenna, I called it "Lambda" just because it can look like the letter itself. This is all just for fun of course and about any length of metal conductor can be configured to radiate RF energy. That's what keeps us all interested in this subject I guess.

Have fun!

Randy,
Sorry you took my post to the extreme level and started trashing me via direct mail.
My writing skills are not the best.
The reason I asked to search is because you will find hams are using that end fed wire in so many different configurations so it is to much for me to type out.
However just a few different ways are a 65 foot vertical as can be,half vertical and the last half horizontal,sloper,or swing the top horizontal part around.
Also geographical locations determine what on will be best and many are using it as an inverted V fed from the end
---
Several times I asked about QRM and the answerers I received were not helpful with QRM so I searched all sorts of key words and close too 2 weeks later I found this site and the person even has an audio file.
My QRM here in this building now is always below an S-3.
Right now i'm looking for some old skinny cheap hi loss Radio Shack coax and trying different cores but it was my own searching that found that site.

From: n5drgdanny
Topic: 3464 Message: 3486

Lynn,
I made the doublet as you described on the last email and your YT video, But for some reason I could not get it to work.
The SWR LED would hardly dim on any of the three bands.

Here was my setup:
I have a 31' fiberglass pole (lightweight)like the one listed here
http://www.windpowersports.com/windsocks/windsock-poles.php

I took two sections of #124 THHN stranded wire taped them together from about a foot from one end to 50 down the line, then split them at that mark to 25' each side for the doublet. Now I did run the wire taped together along the ground for some length as it ws what I have to work with but at leat 30 feet of it was running vert. up the fiberglass pole.

Tried to load up 40m first, then 30, lastly 20, the BLT would not tune anywhere it would only slightly dim the swr led, I was very slow at the tuning process as I know it can be a wee bit touchy.
I used the Low Z, and the High Z settings to find the best match, but to no avail.

Now I was able to load up the EFHWA on all bands, so i feel that the BLT is working. I still need to purchase a ZM-2 for coaxial unbalance feed lines later. but thats another story I suppose.

Any suggestions?

Danny

Hi Danny,

It is likely that the close proximity to ground of part of your feedline is causing the problem. Find some way, even temporary, to get it away from the ground.

I'm curious why you believe that the BLT won't feed an unbalanced load? Both the BLT and ZM-2 are the same basic circuit (Z-Match) and both will drive unbalanced loads. The ZM-2 does have a somewhat wider frequency range and impedance transformation range. Actually, if I recall correctly, the BLT has a larger transformer core than the ZM-2 and might be a smidge more efficient.

Best of luck with your doublet. I'm sure you get it whipped soon.

Lynn,
I made the doublet as you described on the last email and your YT video, But for some reason I could not get it to work.
The SWR LED would hardly dim on any of the three bands.

Now I was able to load up the EFHWA on all bands, so i feel that the BLT is working. I still need to purchase a ZM-2 for coaxial unbalance feed lines later. but thats another story I suppose.

Any suggestions?

Danny

Steve,
I was assuming that the BLT was for just that, I remember reading the instruction book, and it stated:

COAX / BLT SWITCH
S8 is used to switch between a direct coax connection to the BNC jack or the BLT (balanced line tuner). The Coax position is
of course used if you are using a resonate, coax feed antenna or an external tuner. The BLT position is used when the built in
tuner is desired and is normally used with ladder line feed antennas, but can also be used for end feed antennas or possibly
matching coax feed antennas which need a little tweaking.

I also tried using it to feed a G5RV Jr. on the three bands the G5RV Jr. was home brew using 300 ohm twin lead into a BNC Chassis connector then to RG-8X, the BLT in the coax switch did not seem have any affect on tuning the antenna. Am I doing something wrong?

So again I just thought it was for the balanced line or end fed, instead of a unblanede (Coaxial) fed antenna

I am using the Lamda 44 feet to resonate, 25 feet counter poise using speaker wire (thickest gauge i could find) the two wires run together from the PFR-3 for ten feet at table top high, then 15 feet of the counter poise slopes to ground ive had success both times one keeping the end abt 1 foot off groung es two just tossing it on the ground, the 34 feet at the same point takes a 90 degree vertical turn up in a tree. Low Z used to tune 40 es 30 mtr Hi Z to tune 20 mtr wrks fb for me give a try.

Danny,

The BLT is primarily, but not exclusively, designed to drive balanced feeds and non-resonant end-fed configurations.

If S9 is optioned to "BLT" and S11 (rear panel) is optioned toward the binding posts then the coaxial connector is connected to the output of the BLT. The statement " or possibly matching coax feed antennas which need a little tweaking" is correct and, except for emergency operation, I would never recommend that configuration for any condition where the antenna presents a high VSWR to a 50 Ohm, coaxial feedline. If the impedance presented to the coaxial cable is too far from 50 Ohms, you may be able to find a tuner configuration and adjustment which presents an indicated low SWR (LED dim) but the feedline losses will likely be excessive.

As to the G5RV Jr. problem, it could be many things. It could be that you are simply 'passing through' the low SWR settings by turning the knobs too fast. Are you peaking the receiver noise for max. first? Maybe there is an antenna system fault. Have you tried it with a different radio and/or tuner?

I'd need to know more how you have that antenna configured; height above ground, length of balanced and coaxial sections, proximity of the balanced feedline section to nearby objects, etc. in order to make a more educated guess :-).

Danny,

I forgot to mention that there could also be a fault in your BLT. Have you ever successfully used it on any particular antenna configuration (sorry if you already covered this and I missed it).

Also, not that it makes much difference, is your rig a PFR3 or PFR3A?

Steve,
I am not the original owner or builder of the kit, just trying to get it to work.
It does look like the BLT is working though.
I did go back in a remove the main board and make sure the enamel was off of the toroids leads as best as I could, there was some on there but not too much.
before that process I had trouble loading it up on anything but 40 meters.

Now it will load on the EFHWA on all three bands, still likes 40 best though.
I will try to elevate the doublet paired lines from the ground which might help... it couldn't hurt right?

On loading the G5RV up with another radio and or tuner... it worked without any issues.

Thanks,
Danny

Danny,

Well, that's progress!

The reason I asked about which version you have is that early on (PFR3 (no suffix) there was some confusion about how to connect the BLT transformer to the circuit board. As I recall, this was due to a PC board layout issue that could possibly lead to mis-wiring. I can't remember the details off the top of my head. Some searching might reveal those or maybe Dale will check in here on the subject.

Yes, getting the feedline clear of the earth will definitely help.

OK on the G5 Jr.. That pretty well rules out problems with that antenna.

As I recall, this was due to a PC board layout issue that could possibly lead to mis-wiring. I can't remember the details off the top of my head. Some searching might reveal those or maybe Dale will check in here on the subject.

Danny,

I'd first try Dale's suggestion of using a 560 - 630 Ohm, non-inductive resistor as a load on each of the three bands If the BLT is transforming that impedance correctly (the LED goes out) then it is very likely that nothing is wrong with the BLT.

You're welcome. It is my pleasure to be able to help. That is what this Group is all about.

The only "issue" was the hole layout didn't line up well with the wires on the toroid. Also, if you happen to have a very, very early PFR-3, we found there was too much inductance for it to tune on 20M. The number of turns on the primary side should be 11. The original instructions called for 16.

Steve,
I believe the date on the silk screen reads 2009, would there be any other verb-age stating when or if its a very, very early version?

Thank you,
Danny

No, the fix only required changing a number in the instruction manual.
You'll have to open the box and count the turns.

Thanks for the GREAT INFO, Steve. And, thanks, Danny for asking the questions! I didn't realize there had been a change. I bought my PFR-3 from Mr. Hendricks at Dayton in 2008. I've always thought I had done something wrong because my tuner didn't work exactly like I thought it should. Thanks to this forum, I saw the design enhancement. I made the change last night & I'm tickled that it works perfectly now! What a super fine kit!

I would like to know why the winding is 11 turns in the PFR-3(no suffix) yet it is 12 turns in the PFR-3A. Not that 1 turn is going to make much difference. And also why a -2 toroid was chosen over a -6.

Just curious. As Chuck Adams would say, "Inquiring minds (etc.)"

My opinion of the PFR-3 is that it has the best bang/buck ratio of any QRP transceiver kit. Of course, other kit manufacturers may disagree and I'm preaching to the choir here :-).

Because at some point I realized that you need 12 turns to have a truely symetrical center tap. Not that it probably matters much. And I think the inductance was a little marginal for 40M with 11 turns if the turns weren't all bunched up together.

I may have seen that with a dirty set of contacts, and my instant reaction is to grab a clean piece of paper, and drag it through the contacts, holding just a bit of force against them.I've used just about any paper.. dollar bills, matchbook covers, envelope flaps (but watch out for the glue) a strip of sticky note, again watch for the glue, and once in a while, I get to usea piece of clean white paper, that shows a black streak on each side where the dirt came off. I suspect the PFR3 doesn't have a "de-bounce" circuit in it to take care of such correctable situations, where some of the other, larger radios do.

I had the same issue with my PFR-3 with a "kit" key. Repeated cleaning of contacts only lasted so long. When I switched to a Kent Key the problem went away. I then noticed that that the PFR-3A has a bit different key input components. Thought of changing to these but ended up doing nothing since the Kent fixed the problem. The "kit" key worked fine on my other rigs so ended up selling it at a hamfest. The Kent is much heaver but I do not expect to do any back packing with the rig and key.

We Old Timers just get out a dollar bill and drag it through the contacts. It's just a bit of carbon build up. Granted that my Kent does not suffer from this ailment. But I like the little bolt on paddle sold by Hendricks a year or so ago. The arms are stainless steel strips and the contact is just a screw. Nice and light and an acceptable feel.

Date: 2012-02-08 18:27:02 UTC
From: Dale Putnam
Topic: 3515 Message: 3518

The Game Warden has graciously agreed to open the second half of the FoxHunt Season in the 80 acre woods (plus three weeks).
So tomorrow evening, which makes it at 0200z Friday, somewhere in the 40 acre woods (7040 +/- 10) you will
may find a pair of sly fox.. KZ5J and WC7S slinking around handing out pelts (Qs) to the deserving Hounds, (that would be you).
We will attempt to find a clear spot, to howl at the full moon, and we will be expecting answers as we announce.. usually up 1 or 2, or maybe down 1, 2, 3, 4, ... ??Listen well.. directions are to be expected. AND if there are no callers, no one being answered, insurance pelts are welcome.

Ok.. now.. seriously.. we have a lot of fun with these foxhunts and the fine details can be found easily on
http://www.qrpfoxhunt.org/winter_rules.htm

I will be using a K2, at 5 watts, with a switch selecting one of:
a pair of verticals on a steel roof,
a 90 ft center fed at 30 ft, or
3 - 360 foot center fed at 50 ft. The verticals or the long wires can be phased, so if the going gets tuff, and the answers are coming slow.. please call a couple times, but if the answers are fast, one call will do nicely.

0200z Wed. on 3.560 +/- 10 or 7pm Mountain Time Tuesday evening Local time.

Bring your best, and spread out a bit,
Good luck, May the Prop goddessess smile on us all,

Hi Bill,
I have used that antenna for years.
You also cut a fill wave wire for each band.
The pfr3 tuner will tune it with no problem.

Sorry for the typo,
I wanted to say that you can cut a full half wave for each band.
The simple end fed wire is very efficient and about the cheapest antenna
on the market.
The longer 65 foot wire can be run as a sloper,an inverted V or an
inverted L and the pfr3 loads into the 65 foot wire with ease

Topic: 3519 Message: 3522

Hi Bill,

I've never tried one with a PFR-3 but there's no reason it shouldn't work as well as any antenna of equivalent length. Irregardless of what it's called, it is simply one of the many examples of antennas non-resonant on any band of interest. The 44' and 51' are two other examples.

The idea is to get the impedance at the rig end down to something that is within the ability of the tuner being used, in this case the PFR-3's built-in "BLT", to transform to 50 Ohms. That's what the "5 Minute - 5 Dollar Antenna" does.

You should be able to whip up one with almost any sort of wire; lamp cord, twin lead, 'ladder' line or even open-wire line if you are so inclined. Even twisted pair should work OK for the line section. With twin-lead or ladder line, the top 25' "unused" portion does not need to be stripped back. It can simply be joined to the radiator 25' back from the far end.

Best of luck should you decided to build one but most of all, have fun!

Has anyone built WA0ITP's 5 Dollar Antenna, and if so, what kind of results have you had with it? Does it work on all three bands with the BLT in the PFR3A?
His website is:
http://www.wa0itp.com/antennas.html

Just wondering, as I remember reading about this antenna a few years ago, and it got a pretty good report.

Topic: 3523 Message: 3523

Hey guys, if you haven't played with Reverse Beacons yet, you're really missing out on a useful tool and fun time.

Here's how it works. You go to Reverse Beacons Net, on the Internet, go to DX Spots and do a search on your call letters, then send a 3X3 CQ call, and watch the stations that copy you "pop" up on the screen with the time/date, freq. signal report and call letters of the station that copied you. It's so cool.

I was sitting here, and dropped my power to 500 mw (on the K3) and with my indoor 50' doublet watched the stations report my signal. It is really useful, this gives you accurate picture of the prorogation not someone's "guess" as to how it is.

Bill,

Yes, the http://www.reversebeacon.net/ is a very interesting and useful tool. One more thing -- if you think the band is dead -- click the link "search spot by callsign" and enter your own call. Then start calling CQ ... It is a rapid way to check band conditions, or test new antenna radiation patterns. Of course the biggest bonus is when someone answers your CQ! But I have found that occasionally the reverse beacon will prove the bands are open, but lacking any CW signals!

Thanks Bill,

73,

Lynn

Hey Bill,

I have tried the Reverse Beacon Net but have never seen myself show up on the list. I am guessing I work portions of the bands which are not scanned by the skimmers. Just a few minutes ago, I have QSO with WA1NSD and before that I threw out my call many times. Never showed up on the RBN. I was operating on 7.123.5 MHz and I am guessing that the skimmers are looking at stations further on down the band.

From: Petr
Topic: 3526 Message: 3526

Hi,

as Miroslav informed me last week although his famous Rotary encoder kit was retired already he is thinking about its comeback. He is still getting the orders and gathered enough requests for another batch of PCBs and ICs orders to complete the kits.

So my hint is to not wait and check the link here:

http://diy4fun.blogspot.com/2010/01/rotary-encoder-for-ats-transceiver.html

and here:

http://diy4fun.blogspot.com/2010/02/rotary-encoder-for-ats-assembly.html

... and order the Rotary Encoder kit for Your QRP jewel in good time.

Hi Jerry,

Never operate in that part of the band, so I didn't know that. I just ran a test, sent out 3-4 3X3 CQ's at 7.125 and didn't get any "hits", but dropped down to 7.065, and got 4 "hits". With the indoor antenna, WA7LNW in Washington UT, NC7J in Layton UT, N7TR in Reno NV and N6TV in San Jose CA all picked me up.

I usually operate in the QRP part of 40m 7.030 to 7.050.

Learn something new everyday.

Hi Petyr

I was wondering, have these been actually used in the pfr3's? If there was somthing about the design i really felt uncomfortable with, it would be the tunning system.

Thanks for the advice.

Hi Stacy, Yes, I've installed a number of the encoders into the PFR-3 radios. The encoder has also been used on the AT series 3 radios. (different circuitry, same encoder, same original tuning) They are being used by a number of the fellows.

I'd be more interested in how you mount it to the PFR3 case and seeing pictures, if any are available?

I think the price is %25 USD plus $5 USD shipping, if I'm not mistaken.

The encoder mounts on the front panel, with the circuit board sandwiched between the radio main board and the front panel. The tuff part is making a hole for the leds of the encoder. They are a square with two triangles, one on each side to indicate direction. The encoder will allow you to "twist" or rotate the freq, just as fast but no faster than the buttons "push" the freq change. IF care is used during the build, and components are kept at minimal heighth, then no rearranging is necessary. However, many times it is necessary to rearrange the components on the radio board to either lay them down flat.. or very very carefully place them on the other side of the board, however, the care needed is to insure they don't get in the way of a battery pack.

Dale makes an excellent point. This encoder tunes at the same speed as the buttons. In my estimation the buttons are quite adequate. I just place my finger between the buttons and move it left or right. Works great. Over twenty countries so far with my PFR3A. Great field rig.

Yes, Dale, looks to me as overkill for my situation. I don't have a problem with the buttons.
What I would like to see, would be some kind of tuning indicator/signal strength indicator for guys like me with bad hearing. I'm never sure I'm tuned in correctly on someone, within a couple of clicks of the tuning buttons. I guess I'm spoiled by my K3 with the great tuning aids. But, then again, the pfr3 didn't cost what the K3 cost, did it? I love my little pfr3. The other day I worked NJ from CA with it to a 50' doublet strung up in my house.

Hi Bill and all,

I've been experimenting with a very simple zero circuit based on a LM567 and it works great. The drawback is the current consummation at around 20 mA. You can, of course, built a manual or automatic switch-off feature to limit consummation as needed. I find it a bit boring. So I find on internet a radio ham (Swedish if I remember well) who mentioned a CMOS version of the IC. It's called LMC567. I just ordered the components and I'm about to make my first prototype to test. I'll build it on Veroboard and when correctly adjusted will be easy to reproduct.

To follow...

73 de Jake - ON4YZ

PS : This is kind of circuit that will find place on all my rigs. On the other hand, I also own 2 kits of rotary encoders (just in case of...). But I feel very comfortable with the tune-up buttons from both my PRF3A and my ATS3B. So didn't yet open the envelope containing the kits.

Topic: 3526 Message: 3539

Hi all,

well I did not interrupted the discussion as Dale explained all details so nice...

Regarding the encoder itself its not about the ability to tune up/dwn faster but about the comfortable tuning thru band including the nice visibility of the tuning state, scanning etc.

If You would not like to hold the buttons and tune the PFR comfortably as same as big table radios then its suitable for You.

I am using it on my ATS-3A when I am at home and it improving the operation comfort a lot.

Good luck to all,

73 - Petr, OK1RP

I been reading about this encoder.
My prf3 I got from Dale works silk smooth.
It isn't the KX3 but the guy 700 miles away doesn't know:-)
So far I had very good reports working stationary mobile with my Hustler antenna setup on my old station wagon.
I sure like to buy a kit and give it a shot but my eyes are no longer what they used to be back in the 90's when I just went off the air and built kits,starting with the OHR 100-A
Getting back to the pfr3,I like to use a small external speaker and Radio Shack has the small audio AMP unit.
Scroll down on this page and you'll see a small 1 watt audio amp kit.
I think that will fit in a small box that comes with a PICO keyer and I have an old non working HT here and that speaker will fit in the box and it's also very flat.
So that's going to be my next poject.

3542. Housing freckling under Krylon clear coat

Yahoo group: pfr3_group
Date: 2012-02-20 15:25:22 UTC
From: Bradford
Topic: 3542 Message: 3542

It has been a week since I applied the decals on my PFR-3a housing and applied the Krylon satin finish clear coat over the decals. Now I am starting to see areas of freckling between the Krylon and the housing paint finish. I thought I had done a super job until now, things seem to be headed south!
I am not aware of any easy fix for this,I am afraid there was some contaminate left on the housing after I wiped it down. That being the case I think I will have to buy another housing cover and redo the whole decal / Krylon task again. What are others using to clean the housing without harming the paint finish??
I would gladly pay a little more for a silk screened housing like they had at first.
Anybody else have problems like this?? Any ideas on getting out of this mess or good cleaning procedures??
Tnx es 73 to all.
Brad N1VWD

I have built five different Hendricks kits and have not encountered that problem. I always wash the cabinet with alcohol prior to applying the decals. The powder coat finish is quite tough and will not be harmed by a quick wash. I think that washing in Dawn dish washing detergent would work quite well in lieu of alcohol.

I would not panic as you have two sets of decals. Remove the Krylon with a solvent like alcohol or whatever other solvent you might have and redo the job. It should not attack the powder coat if done fairly quickly. Alcohol will attach the Krylon quite quickly in my experience.

I would entertain the idea of cleaning up the unit and re doing the job even if it called for a new coat of safety yellow keeping the cost down as opposed to a new case. shucks i might even choose a different color part of the magic of the build.

Hi Brad,

I've had exactly the same experience with my PFR-3, built a few months ago. It started with freckling and then the decals lost their bond and have flaked off, either partially or completely, and the face of the rig now looks - well - a mess. I too used the Krylon spray and I first cleaned the housing with alcohol and let it dry, before applying the decals.

I re-did my decals twice. The first set of decals disintegrated while applying them, after only a few seconds contact with water. The replacement set went on OK, but have not lasted.

I'm not a novice decal user. And I've made several other of Doug's kits using decals and they've been OK. They've lasted a lot longer than this.

I'd happily pay for a silk-screened enclosure after this experience.

It's a pity that such a fine rig is let down by a poor detailing technique.

73 es GL!

Hello all
I had some difficulties integrating the Decals
and then the varnish that I used was a coating for metal
the result is good on the photo you can see for pfr3 of F6DDV, but as we look closely we can see the thicknesses of Decals, I do not like my work ...
I think the turpentine can also go, but some are resistant varnish.
The most aggressive of the acetone will be, we must be careful and proceed by testing with little product.
It is still possible to repaint it with a car paint if it is a disaster ...
Good luck!

With a number of the first PFR3s accomplished, and a whole lot more of the decaled ones completed, many didn't stay here very long. I'd expect to hear from the owners if there were a problem. The few that did stay here, didn't exhibit that problem. However, I did like the painted case much better. The decals, for the most part, work well enough, however, there were some that were very thin.. and fragile. difficult to handle and very sensitive to any contaminate left on the panel. I too use alcohol to clean with, and I had to clean some of the cases with it a number of times to accomplish a clean surface. I used distilled water, to slide the decals with, and three to four coats of clear coat on top to finish... after a very thorough drying before the first coat was put on. This is a very good radio, very useful, and built for the trail.. or saddle bag. Hard to lose, and easy to use. I would like to have the option of ordering the silkscreen panel, IF that would be possible. I'm thinking that is just wishful thinking tho.

Hiya Dale

Clearly, you have a organic solvent/contaminant on your enclosure.
Possibly, picked up post production, check around your bench or work area.

Therefore, you really need to start again! Try tolurene/methy benzene to
degrease, before you start your preparation!

Has the enclosure been near any flux?

Good luck.

Hi Stacy, I haven't had any problem with the decales... freckles or flaking.. other than the ones that were just very fragile, straight out of the box. One could feel the difference in them, compared to the rest. Other than that.. no problem. And your comment about flux, is accurate, as is contaminants.. that was what I was pointing out too. Have a great day,

It would NOT be possible to add additional bands, though it might be possible to make it work on a different band, provided it fell between 40 and 20 meters, which there are none.

Hiya Steve

Firstly, mine is crystal controlled I think, but all the parts are still in their bags. Please forgive me for that mistake.

You dont think a DDS vfo could be squeezed in there somewhere? It might be nice to have CW on the other bands too!

Just a thought:-) Probably a really silly one too.

Thank you for your reply.

Hiya Steve

Its seems, im putting my foot straight in it today! The DDS is allready on the PCB, fantastic.

How come it will not go upto 80 or down to 17, my favorite bands? Perahps, I should read-up'on the ADS9834 before making a fool of myself. Some times, my curiosity just gets the better of me and, of goes my mouth:-) Such is life.

For size and cost reasons, it was decided the PFR-3 would only do the three most popular bands for portable use.

3556. PFR-3A Tuner and RX Peak Question.

Yahoo group: pfr3_group
Date: 2012-02-23 04:12:10 UTC
From: Roberto
Topic: 3556 Message: 3556

To the PFR-3 group:
My PFR-3A works fine but, I have noted that when on 20 meters, the RX peak tunes almost at the far right side limit. On 30 meters, I get a good RX peak when it points to the 40 meters mark and at 40 it gets the best RX tuning when is almost at the far left.
I barely made it into both limits for 20 and 40.
Is that a correct behavior or am I the only one with that problem?

Please comment.

Hi Rob,

That is typical operation; 20 and 40 peak just at or near the limits of rotation.

OK Will re-check.
At the begining, I had one extra turn in everything, when I first built the radio. I had to unsolder ALL toroids and the trasformer (including T1 and the big tuner toroid) and, I re-coiled them with one LESS turn.
It now matches with the latest manual by counting the turns in the number of wires PASSING THROUGH THE CENTER of the toroids.

One more thing, just for the record... All 3 variable condensers are showing half moon as the manual recommends.

Will check again on T1.

What would the tendency be... if I have more turns on T1 or less turns on T1?

Rob.

Good evening Rob.
I think it is possible to count the turns of wire on the picture that I put as an attachment, be afraid that it can help you,
because the T1 is may be more difficult.
This is the T1 just before I welded on the circuit.
I made this way and trimming is near the edge of the peak for the RX band 20m, but it is up, no problem.
Do not be concerned if the peak is not well in front of figures of 3 bands, it works well the RX is very sensitive anyway it's not a problem.

3564. A useful tool

Yahoo group: pfr3_group
Date: 2012-02-24 19:56:58 UTC
From: JohnK
Topic: 3564 Message: 3564

Of all the problems encountered in building various kits, I have found the most frustrating and irritating to be in the area of the tuned circuits. I have wound and re-wound countless toroids, soldering and unsoldering, adding and subtracting turns,(all the time trying not to wreck the PC board), just trying to get the proper value. These are usually fairly simple tuned circuits. The caps are pretty well marked for value, but getting the proper inductance values of the toroids can be a case of trial and error. I have found a very effective instrument to measure inductance put out by Almost All Digital Electronics. It is a simple, one evening kit for about $100. It measures capacitance and inductance, and appears to be quite accurate. If you know the formula for the frequency you are after, and the capacitance, this will tell you when your toroid is wound for the proper inductance. It is interesting to see the effect of variables such as number of turns, core and wire size, and whether the spacing makes a difference. All this can be measured and observed before you install the toroid. You can use a formula for the capacitance and inductance needed,or,even better, the required value of the inductance in the circuit could be provided by the designer. I have no connection to Almost All Digital Electronics, I just think they have a useful product that can save a lot of time and trouble. John, W7COI

3566. Alternate Decal Installation

Yahoo group: pfr3_group
Date: 2012-02-29 21:43:26 UTC
From: kybarney
Topic: 3566 Message: 3566

I tried an alternative way of applying the decals. For me it works better, and thought I would share it with others. Here's what I did:
1. Spray the bare case with matte krylon and let dry.
2. Cut a piece of clear contact shelf paper, peel paper back off, and face adhesive side up on a desk.
3. Take entire decal sheet and soak in water for a few seconds.
4. Take decal from water and press firmly onto adhesive side of contact shelf paper to transfer decal. This is instead applying the decal to the PFR3 case.
5. Soak up excess water and peel back off decal.
6. Take another piece of contact paper and peel off paper back.
7. Press adhesive side down over decal.
8. The decal is now preserved between two pieces of clear laminated shelf paper and can be handled freely.
9. Cut laminated labels out to desired size.
10. Affix labels to PFR-3 case with 2-sided tape. I used photo safe tape so I could re-position the labels, if needed.
11. Once all the labels are in place. take the contact shelf paper and wrap both halves of the PFR-3 case.
12. You now have a laminated case, which encases laminated labels. I think

I finished mine this morning and it looks great, IMO. I will try to post photos if anyone is interested.

The contact shelf paper used is similar to this one:
http://housewares.hardwarestore.com/37-188-contact-papers/clear-contact-paper-101549.aspx

3567. FOX: Thursday Night 40M Fox Hunt

Yahoo group: pfr3_group
Date: 2012-03-07 13:58:22 UTC
From: Dale Putnam
Topic: 3567 Message: 3567

Here's a typical FOX announcement, and this one is for this coming Thursday evening. We're getting close to the end of the winter hunt season,Al and John are great FOXii ops, so grab the pelt, while you can.Good Luck to all,It's a fine day for a FOXHUNT, folks,

--... ...--
Dale - WC7S in Wyhttp://www.qrpfoxhunt.org

Hello all: I will be one of your QRP Foxes Thursday night, 0200-0330Z

(Friday UTC) somewhere between 7030 and 7050 kHz. Al, K2ZN, in NY will

be the other Fox. We will be running 5W, of course. I will be using a

coax fed half wave 40M dipole up about 50 feet and running north and

south, so it will favor east and west, but is a pretty good all over

antenna. I will start out split listening up and will indicate that by

sending "UP" at the end of the FOX call. When the pileup diminishes, I

will be listening on my own frequency and will stop sending "UP." I

will be giving "real" RST reports. Transceiver will be an FT1000MP

running at 5W as measured on the WM-2 QRP Watt Meter. My logging

computer is out so I will be logging on paper and that means I may be a

bit slower and will have to be very careful in transcription to a log

report that will be posted on the QRP Fox Hunt Reflector. I will be

able to use a memory keyer. Callers should be running 5W or less. I

hope you can all work both foxes Thursday, but know that closer in

stations may have trouble due to the skip usually found on 40M.

However, at about the same time in the ARS Spartan Sprint on 40M this

Monday night, I was able to work stations in AL, FL, and NC. Best

chance is at the beginning of the period, which is 0200 to 0330Z.

However, don't give up, as skip often shortens up toward the end of the

period. Exchange is RST, SPC, Name, and power and you can work only

the two Foxes.

73, John, K4BAI.

I finialy have been able to do some more work on my little yellow box.
Had one small error on my part did not read the instructions fully
When is tells you to install resistors 16 to 23 it means all of them not
just R16 and R23 after adding the missing resistors smoke test #1 passed
unable to check the DDS no receiver this will be my only rig.

I found a great way to form the leads place the body of the resistor on
the inside of the case and then bend the lead down on the out side the
spaceing will be just right. One other tibit I pre wound all fo the
toroids and transformer before I started
I have read all your inputs and thanks for all the help

73 for now

3572. decals - finish spray??

Yahoo group: pfr3_group
Date: 2012-03-11 09:08:30 UTC
From: Andreas
Topic: 3572 Message: 3572

Hello group.

First: Installing those decals was the most awefull work ever!
Increasing the prize a little and print it on the case would be a better solution - my opinion.

But that's not the problem: What finish spray did you use?
That Krylon is not available in Germany.
Is there a good alternative, especially to buy in DL?

What type of paint is it: acrylic or synthetic resin??

Thanks for reading - Good sunday.

Andy, DL1AKP

Hi Andy,

Krylon clear is a clear Acrylic spray. You can probably find it under some other brand. Some of the art shops might stock clear acrylic spray.

Subject: [pfr3_group] decals - finish spray??

Hello group.

First: Installing those decals was the most awefull work ever!
Increasing the prize a little and print it on the case would be a better solution - my opinion.

But that's not the problem: What finish spray did you use?
That Krylon is not available in Germany.
Is there a good alternative, especially to buy in DL?

What type of paint is it: acrylic or synthetic resin??

Thanks for reading - Good sunday.

Andy, DL1AKP

3575. Pfr3 - TSA Friendly???

Yahoo group: pfr3_group

From: n9lmv
Topic: 3575 Message: 3575

Hi all, I am new to the group so if this has already been discussed please accept my apologies. I am still in the research stage of things ad have not yet purchased a pfr3.

I travel a lot and would like to be able to bring a nice qrp rig for QSOs from the hotel. I often have to go through airport security with my overnight bag and was wondering if anyone has experience with the TSA and the pfr3? What about portable antennas?

3577. FOX Results thru Hunt 34

Yahoo group: pfr3_group
Date: 2012-03-15 13:15:26 UTC
From: Dale Putnam
Topic: 3577 Message: 3577

Results through Hunt 34 are posted on the Web page: http://qrpfoxhunt.org They reflect the condtions on the bands, to say the least. There is drama and excitement as the finishing hunts come down to the wire, for one, the teams are getting a hard run on 80. Who's going to pull that one out of the hat? Then, how about the rights to Top Hound on 80 or 40? Or the TOP FOX on 80 or 40 ? Who is it going to be? Inquiring minds want to know. And if you don't want to miss the action, drop by tonight and see the action, first hand, on 40. With all the solar activity of late, it will be an exciting and invigorating time for all. And some of these Foxii.. are masters at the hunt.... I learn something new every time. Good luck to each, FOXii and Hounds, newcomers and experienced, y'all come, y'hear?

3578. Rotary encoder for PFR-3 ready for shipping again

Yahoo group: pfr3_group
Date: 2012-03-16 12:05:05 UTC
From: Petr
Topic: 3578 Message: 3578

Hi,

this message arrived tonite from Miroslav,

Hello,

I would like to inform you that the kits of rotary encoders for are ready. The price remains the same 25 USD for one kit. The shipping cost is 5 USD for one kit, 6 USD for two kits and 7 USD for three wordwide. You can send the payment to my Paypal account diy4funatgmaildotcom ...

As same as the PFR-3 also all of the ATS series are compatible. The new MTR radio support is expected...

If you want to send the kit to different address than you have in your Paypal account, please let him know either in payment note nor in email.

So probably last batch of these kits is available now for these famous QRP partable radios.

Good evening Petr
It is interesting
I see many examples, but perhaps this would be especially interesting is to see pictures of the mechanical
and electrical Rotary encoder for PFR-3 inside the pfr3, just as some show the assembly of this TX 3 yellow bands.
Maybe someone did the editing, and maybe I have not seen anything.
It is possible that I have not seen the good hyperlink to the right website.

I'm looking forward with anticipation to the last hunt of this, the 80m season, with N9AW, Jerry, and KI0II, Ron being the Pursued Foxii.. and a fine pair of FOXii they both are too. It is also noteable that this will be the last FOX outing for Jerry as a member of the Fox Committee, we will miss him in that capacity, he has been very tireless, and helpful, always striving to improve the FOXHUNTS. My best wishes to him as he continues with his professional approach in future challanges and endevors. And Best of Luck to Ron and Jerry, fine ops both, for a good hunt, with the start being with greyline overhead in parts of the country, it will prove to be a challange to grab a pelt, and interesting to watch the propagation princess as we recover from the past solar penominons... (fonenetically, right?) 80 is predicted to be fair in day and good at night.. and with that, prognostication... who can tell? See you in the hunt, and Good Luck to all and to all a Good Pelt!

3582. fault tolerance of PFR-3?

Yahoo group: pfr3_group
Date: 2012-03-25 14:16:14 UTC
From: Andreas Nagel
Topic: 3582 Message: 3582

Hi there,

would be interesting to know how "fault-tolerante" the PA transistor oft he PFR-3 is.

I am now in the end part of getting the rig together (means only T3 has to be done and testing TX)

But what happens, if I send without antenna, short-circuit-Antenna, miss-tuned antenna??

Does anybody know? It's important, because on portable it can be easely something wrong in the setup.

Thanks a lot, 73 de Andy, DL1AKP

Hello Andy,

The "binding posts" are the red and black terminals with plasitic bodies. They are used to connect wire antennas and balanced wire feed lines to the PFR3.

The ends of the wire opposite of the binding posts must be soldered to the pads on the PC board marked "BP"; one wire to each pad.

Best of luck with your PFR.

3586. Re: [pfr3_group] fault tolerance of PFR-3?

Yahoo group: pfr3_group
Date: 2012-03-26 02:39:09 UTC
From: Steven Weber
Topic: 3582 Message: 3586

You can transmit indefinately into an open. Very little current is drawn by the PA when there is no load. Short circuits can be tolerated for short periods of time.

The main problem is with highly reactive loads when operated at full power of 5 watts. This can cause the mosfets to exceed thier current rating.

But seeing that very few if any of the PA fet's have needed to be replaced in the several years these rigs have been in use, it appears that they are reasonably fault tollerant.

72, Steve KD1JV

would be interesting to know how "fault-tolerante" the PA transistor oft he PFR-3 is.

3587. Secure coils?

Yahoo group: pfr3_group
Date: 2012-03-27 17:59:25 UTC
From: Andreas Nagel
Topic: 3587 Message: 3587

Hello folks,

did you secure the toroid coils with some kind of glue? To keep them in place just in case of rapid movements or shacking of the yellow box?

Or maybe even put the pa-transistors in sockets for easy replacing? I am in the final testing now. Everything is fine until now.

Output power is about 5 watts, but not measured correctly. Will do in QRL next week.

Thanks for reading, and answering.

Andy, DL1AKP

If you secure the toroids, use something which can be removed, like a dab of hot glue.

I would not socket the PA FET's, that would be asking for trouble.

Hello
You can put a drop of glue below the torus, it is useful, but only once you are sure everything is OK,
and that the power does not exceed 5 W of the 3 bands by moving the coils on tori.
Personally, I think BS170 are very robust, I would not put media in your place of transistors,
the contact resistance or a bad contact on mosfets can cause destruction if there is an imbalance.

Steve -
I have tried my darnedest to tune for a dimming LED however slight, but thus far I can only get it to dim (slightly) on 20 meters. My antenna is a Carolina Windom 160 which according to my MFJ-259 with fresh batteries is almost resonant at :
Freq SWR Resistence
7.076 MHz 1.53:1 27 ohms
9.8 MHz 3:1 16 ohms
14.55MHz 1:1 36 ohms

I have one of those new QRPometers on order, but is there anything else that I might check first?

3591. FOX: 40 Meter Fox Hunt - Thursday

Yahoo group: pfr3_group
Date: 2012-03-29 15:23:17 UTC
From: Dale Putnam
Topic: 3591 Message: 3591

The Last regular scheduled FOXHUNT of this season, in the 40 acre wood, is being hosted by two very fine FOXii, WA4ILO and K9CW, fine operators/foxii.. (Thursday evening, 0100z, +/- 10 fm 7.040) and what a fine way to end the season, but to grab a pelt from each of them, in the 90 minute allowed to chase the fox. Check the rules: http://www.qrpfoxhunt.organd you can also find the results for the season so far. Now.. if the Game Warden sees fit, (is pleased with the turnout) the rumor is: There may be one more hunt.. in the combined forest, 80 and 40, with all the FOXii available to be chased. But the Warden has been very clear, if the turnout for this last hunt in the 40 acre wood isn't satisfactory..... My best wishes for a grand and fun hunt to each of the Fine Foxii and to each and every one of the hounds. It is a certainty, there will be pelts, to be had, and fun for all. Tis a fine day for a FOXHUNT!!

Hi Lee

I've had no luck using the built-in-tuner to tune an antenna attached to the BNC (coax) connector.

If you make an adapter so that you can hook your Carolina Windom up to the binding posts and then switch to BLT, I bet you can then tune it. I have no trouble tuning my dipole with that arrangement.

Please let us all know if that works out.

3593. Old problem with straight key. Software upgrade?

Yahoo group: pfr3_group
Date: 2012-03-30 14:49:28 UTC
From: Roberto
Topic: 3593 Message: 3593

Hello guys.

My PFR-3A is not working fine with straight keys.
When I am keying, sometimes it lacks behind and it is annoying as you try to compensate and, next second it works fine screwing your sending up.
I assume this is a PFR-3A as I bought it directly from Hendricks back on December 2011 (3 to 4 months ago) so no software update should be required, but I am starting to believe I am wrong. The 28 pin DIP does not have any "yellow" dots or "red" dots on it though.

Well, I have read it in past messages and I have tried to fix it with normal end user solutions:
Turn on the PFR while pressing the CW Straight key down.
Using a stereo plug instead of a mono.

Working with paddles is wonderfully OK.

I have also noticed that when tuning up or down and you pass a CW conversation, you stop and go back to hear it, sometimes the radio seems not to understand the order and stops, then on the screen, shows the band ID (20, 30 or 40), the audio stops and the digits blink, just like it does when you change from one band to the other. So you have to release the up or down button you were using and press it again to continue tuning. Looks like it somehow resets. This behaviour is done randomly and is difficult to duplicate so I have not found the condition under this happens but only does it when tuning up or down and for a long time, just like you do when browsing the band looking for CQs. I mention this just in case is a known bug on the software. Software upgrade?

My questions:
-How do you make sure you have the latest software installed?
-Is there any other solution I have not tried apart from a software upgrade to fix the straight key problem?

Saludos

From: Dale Putnam
Topic: 3598 Message: 3598

The following was posted on another reflector, I didn't want anyone to miss out on the fun!!
So thank you for letting me cross post this.

Have a great day,
Dale - WC7S
http://www.qrpfoxhunt.org

Do you miss the Fox Hunts yet?

For a reminder of what it was like, tune in next Thursday evening for the

FOXTRAVAGANZA!, traditional celeabration of the recently concluded Fox Hunt

season.

The FOXTRAVAGANZA! will take place on Thursday April 12th, just like a normal

Fox Hunt, sort of. It will start and end at the usual local times (0100Z -

0230Z), and the Foxes will operate somewhere within 10KHz of the QRP frequency.

But get this-- ALL of the Foxes, the Alternates, and Committee members can

call CQ FOX, on either 40M or 80M or both. An hour and a half of furious fun,

with no rules as such....

The Foxes won't expect to work as many Hounds as in a normal hunt, but the

Hounds should expect to work a LOT more Foxes!

Good Luck! And may the Fox be with you.

3599. FOX - EXTRAVAGANZA TONIGHT

Yahoo group: pfr3_group
Date: 2012-04-12 13:04:23 UTC
From: Dale Putnam
Topic: 3599 Message: 3599

The FOXHUNT EXTRAVAGANZA has been authorized to open this evening, at 0100z for 90 minutes of the best fun around.Yes, it is qrp, we don't want to cause any undo qrm to anyone. In the 40 and 80 acre woods, 10 hectors (khz) either side of the center tree (marked with either 3.560 or 7.030 by the warden). The FOXii, (all of the FOX and alternate FOX this season) will be slinking around either of the woods, for the sake of handing out pelts, jumping between the two woods, so be very alert. When you spot one,give a shot, just remember, you may only use, #5 shot, or less, while swapping RST, State, Name, and power. The summer season, (in the 20 acre wood) will be authorized by the Game Wardens (Fox Committee) later. They feel that the FOX need to take a rest. (how much rest does a FOX really need?) Good Luck to all.. and to all a GOOD HUNT!! AND thank you, Colorado QRP Club, for all your support!!

3601. Re: fault tolerance of PFR-3? (how to use Tuner with coax)

Yahoo group: pfr3_group
Date: 2012-04-18 16:44:37 UTC
From: wb8yyy_curt
Topic: 3582 Message: 3601

Lee

This thing is not intuitive, but indeed a useful coax tuner is lurking here. It is not obvious when not having the schematic to look at, and at first glance I certainly did not figure it out.

First there is the coax switch on the front panel (or top) of the rig. Coax position connects up rig directly to antenna via coax jack -- eliminating the tuner.

To use coax with the tuner -- one must have two switches in the correct setting. First, connect the front panel to BLT. However, still the circuit is incomplete -- unless the read panel switch is also in the correct position. This correct position for coax literally connects the black plug to ground, and the red one to the coax center contact. Labelling this back connector for 'bal' and 'coax' with a marker may help.

You should use a DVM to determine the back panel switch setting that gives the required connections, while figuring this out.

Looking at schematic, this back panel connector 'moves' the coax connector from direct connection to PA/Receiver to the other side of the manual tuner -- but note the front panel switch must be in BLT position to remove coax connector from the direct connection.

For those using a direct end-fed wire attachment -- another mode is involved. Here select the BLT position on front panel, and use the coax position on the back panel switch.

I really need to label my unit, because I forget also.

3602. Group 2 smoke test - works, sort of?

Yahoo group: pfr3_group
Date: 2012-04-27 01:25:52 UTC
From: billetter1
Topic: 3602 Message: 3602

I have gotten my new PFR3a to the Group 2 smoke test without letting any smoke out yet! But the results are not what I expected and I have a few questions:

1. I can receive some CW signals, but the receiver does not perform as well as the other receivers here in the shack - it doesn't hear very well. I have compared receiving across R1 with receiving at the end of C3 (not unsoldering the end of C3 and still using the ground of R1) and it does receive a little louder at C3. However there doesn't seem to be a huge difference to my ear between no antenna and then R1 and then C3, although the signals do get progressively stronger, just doesn't seem by much. Is there something that I can do to experiment a bit more with this to see if there is a problem and if so, where it is? I can peak the noise on 40M with C1/2 and it is peaked at the counter clockwise rotation of the capacitor.

2. I am a bit challenged at figuring out how to save the Reference frequency calibration. I am using a frequency meter and I can adjust the calibration to 10,000 KHZ - which is great fun. However, I am a bit thick when it comes to saving this. The manual seems to say save the adjustment by hitting the Keyer switch or skip the adjustment by hitting the Keyer switch. That seems to be the same to me, what am I not seeing? Then the manual also refers to the Menu switch. What is the difference between the Keyer switch and the Menu switch? I have been using s1 and it enters and moves through the calibration displays correctly as far as I can tell, but I have not been able to save anything so far.

Thanks for your patience and help with this.

Bill

From: Steven Weber
Topic: 3602 Message: 3603

1. Signals will be weak until you get everything else built and a real antenna connected.
2. "keyer" and "menu" mean the same switch.

>The manual seems to say save the adjustment by hitting the Keyer switch or
>skip the adjustment by hitting the Keyer switch. That seems to be the same
>to me, what am I not seeing?

If you do not make an adjustment to the frequency, clicking the keyer switch will simply store the default value back into memory, which is the value it started out with. If you adjusted the frequency to 10.000,000 MHz, the new value will be stored.

If you re-enter the calibration mode, the calibrated value will be replaced with the defaul value and you have to start all over again. This is explained in the manual. If for some reason the EEPROM memory gets corupted, we can always start with a known good value by entering the calibration mode.

Rest assured the numbers are stored. You can only prove that indirectly, which is also explained in the manual.

3604. Re: Old problem with straight key. Software upgrade?

Yahoo group: pfr3_group
Date: 2012-04-27 14:56:02 UTC
From: Roberto
Topic: 3593 Message: 3604

Well guys.

The PFR-3A keyer defaults to 20 WPM.
So, if I use a straight key and send at 20 WPM or more, then I have no problems at all.

Yeap... not an easy task for a beginner.
Straight keys are the best to learn to send good code as you have no chance to cheat at all with them.
Apart from that... that is the only flaw I have found on this nice radio: Do not use straight keys with it; the keyer just does not work properly with them. I read all past posts, did what was suggested to others and it didn't work for a solution.

Have made wonderful DX contacts with this radio and its 5 Watts (conditions had been good of course). It is a joy to use.

Take a look at my low quality simple videos on the PFR-3A on www.youtube.com/Robertosala1
Intended for the beginner and to encourage interested people in becoming Ham Radio Operators. They show that, with little resources you can have fun in this rewarding hobby. No need to be a big gun to have fun and serve.
My simple videos include my signature: Latin American poor English accent and the usual noise of hundreds of parakeets flying over.

Thanks to all the ones who responded and tried to help me to fix this problem.

> Working with paddles is wonderfully OK.
>
> I have also noticed that when tuning up or down and you pass a CW conversation, you stop and go back to hear it, sometimes the radio seems not to understand the order and stops,

then on the screen, shows the band ID (20, 30 or 40), the audio stops and the digits blink, just like it does when you change from one band to the other. So you have to release the up or down button you were using and press it again to continue tuning. Looks like it somehow resets. This behaviour is done randomly and is difficult to duplicate so I have not found the condition under this happens but only does it when tuning up or down and for a long time, just like you do when browsing the band looking for CQs. I mention this just in case is a known bug on the software. Software upgrade?

From: billetter1
Topic: 3602 Message: 3605

Hi Steve -

Thanks for your response, it was very helpful.

I neglected to mention in my original message that I was using my station antenna across R1 and also connected to C3. Hopefully that doesn't change your statement about weak signals being normal at this stage of construction.

Your explanation of how the values are stored helped tremendously! Even though as you point out that it is in the manual, for some reason I just didn't get it - but I think I have it now.

I just repeated the calibration procedure again. If I understand your explanation, every time that I enter CALr, the default values get loaded over what had been previously saved. I missed that, and that makes everything a lot clearer!

I used a scope to calibrate the IF offset and I did not see 2 peaks, only 1. This seems to be similar to the results reported in one of the earlier messages about this process, but I did not carefully match anything such as crystals and capacitors - it just worked out that way.

Anyway, on to the transmitter section.

I would like to thank you for designing this kit so that it can be tested as it is being constructed. This the first kit that I have built that is like that and it makes a huge difference in finding problems and also in understanding what is going on.

Hi Rob,

Have you tried first setting your keyer speed to whatever you are comfortable with on a straight key before sending with the straight key?

I watched your PFR3 videos and found them to be quite enjoyable and educational. A great introduction to those not familiar with the radio.

Hola Steve.

Yes, I have tried but you only have two options:
Turn on the radio with paddles installed or with straight key installed.
If the radio was turned on with paddles, set your speed, remove the paddles, and install a straight key, the straight key will function as a set of paddles sending only dots.
If you turned on the radio with the straight key, then no keyer functions are available because the radio recognized the straight key from the beginning and all keyer functions are now disabled including the setting up of the speed.

That's how it works and it is correct, except that, somehow, some of the keyer functions are still active disturbing you and screwing up your code sending. Definitively looks like a software problem.

Too bad because used to take the radio to my office and tried to use it to have some QSOs with fellow members of the Straight Key Century Club during my lunch time (with a long wire as antenna). I can only work SKCC from my main rig at night :(

A small set back though.

Hey, I am glad you liked the little videos. :)

Topic: 3611 Message: 3611

Hola a todos desde San Salvador.

Just put together this small 5 minutes video to keep a record of my little QRP best QSOs.
I am amazed, as a beginner, with what you can do using only 5 Watts, a good antenna and the right propagation conditions.
Exciting DX can be done with little.
No need to spend big amounts of money on huge equipment in order to have fun too.

I know. Many of you have made longer contacts but this video is from a beginner to other beginners.
It is also intended to encourage ham operators to start doing CW too.
If I did it, you can also do it and much better too!!!

Hope you like it.

Enjoy.

Rob, how is the back of the paddle attached to the front panel of the PFR3?
I have Bulldog paddles and the threaded mounting hole is on the bottom of
the paddle, which is clearly not how your Bulldog paddle is attached.

Thanks & 73,
Barry N1EU

I love the feel of the bull dog paddles, but they just don't last. I've gone through 3 of them. I now use the DCP (dirt cheap paddle) from American Morse. They work great, have a great feel. I pretty much use them for everything now. and guarenteed for life!.

Barry,

The phone plug sticks out beyond the back of the paddle so that it plugs right into the radio. There are two 1/8" holes on the base of the paddle so that you can screw the paddle directly onto the radio and keep it there for outdoor use.

I keep my paddles on the radio and use my Benchers with my TS530s. When in transport, I fold the paddle arms down against the radio.

Rob, how is the back of the paddle attached to the front panel of the PFR3? I have Bulldog paddles and the threaded mounting hole is on the bottom of the paddle, which is clearly not how your Bulldog paddle is attached.

Thanks & 73,

Barry N1EU

Out of curiosity Roland,

What part of the bulldog paddle is it that doesn't last? I ask because I've had mine for about a year now and it still works great.

Be well,

The bulldog paddles I used had the cord. I used them for various rigs. To be honest, I didn't treat them with kit gloves like my other keys. When it failed me, I was out in the field. At the time I had a back up whitebrook or something like that name. It's okay, Not epic, but it got the job done. I guess I kinda toss that one around too.

3625. July 21st local - a Saturday bunch of fun

Yahoo group: pfr3_group
Date: 2012-05-01 17:29:17 UTC
From: Dale Putnam
Topic: 3625 Message: 3625

There is a cure for the summer doldrums... hot summer nights... how weeks in the city... summer... in the city.... got the answer.. I do.. and you can too.. make plans now for a simple three hour event... and celebrate the awesome magic of Steve Weber's ATS radios... they simply perform, and they do it in such a way as to let one relax, rather than get all worked up. So.. lets go have some fun, grab your to-go bag, and set up on a cool hilltop, ormountaintop, or park.... no.. not under the waterfall, maybe close.. but not that close. Check it out... http://ats-sprint.blogspot.com/ Now someone is about to ask.. just exactly how is it that the PFR3 could play in an ATS radio event?.. the answer is simple:KD1JV designed them both.. so they are all in the same extended family. And barring family squabbles... they do all talk to one another.http://ats-sprint.blogspot.com/ There has been some folks asking about multi ops... and multi radios... the answer: Sure why not? and one fellow I know of is making this the first outing for his wife, a brand new General.. to make a trip to the mountain top and enjoy the radio together.What a blast that will be. and one last thing.. Steve is going to be on the Continental Divide.. and hopefully he will be able to be on too..Make plans.. this could be a blast!!

3628. Entering Keyer Messages

Yahoo group: pfr3_group
Date: 2012-05-07 03:19:54 UTC
From: jwpetrov
Topic: 3628 Message: 3628

Hello all:

I just recently purchased and assembled my PFR-3A. It was a fun kit and I enjoyed the assembly process.

My questions have to do with entering messages into the keyer memory. I was hoping to be able to enter a CQ sequence. So, my first question has to do with character count. If I understand the documentation correctly, a sequence of CQ plus a "word space" would take three characters... Right? For some reason, even though it sounds fine as I key the message, I can't seem to get a good message to play back when I click the MENU button.

Any suggestions would be appreciated.

Thanks and 73,

Jed
AD7KG

Had the same problem myself.
So I recorded a CQ sequence, played it back (it sounded completely out of time and sequence) till I understood the problem with the timing so I had to adjust myself only for the recording process.
In other words... I had to adapt my keying till I got it right at playback. I believe I had to do it slower.
Nope. Never got a response or any explanation on that. Hope this time you get more help.

Rob.

My questions have to do with entering messages into the keyer memory. I was hoping to be able to enter a CQ sequence. So, my first question has to do with character count. If I understand the documentation correctly, a sequence of CQ plus a "word space" would take three characters... Right? For some reason, even though it sounds fine as I key the message, I can't seem to get a good message to play back when I click the MENU button.

Any suggestions would be appreciated.

Thanks and 73,

Jed

Jed & Rob

I have found the timing is a bit critical. I leave a little more space between letters (i.e. don't even come close to running them together). Leave a good long space between words and it will be reduced to a normal word space.

Practice on some short messages and you will get the tricky timing sequence down.

73 - Good Luck

Rob/Mike:

Thanks, guys, for the replies. I had the keyer set to 20 wpm and I did indeed find that I needed to slow down and put a bit more spacing in my characters, including the "word" spacing. (ie, long pause between words just to make sure) I finally got my 3x3 CQ exactly as I desired, but it did take some practice.

As far as character count goes, it looks like mine was 31 characters. I suppose that answers how the characters are counted in the keyer.

By the way, Rob, I've saw your PFR-3 video on YouTube... nice work and thanks for taking the time to post it.

3632. Re: [pfr3_group] Re: Entering Keyer Messages

Yahoo group: pfr3_group
Date: 2012-05-07 17:12:51 UTC
From: Steven Weber
Topic: 3628 Message: 3632

The program uses "ideal" timing to determine the end of a letter element group or a word space. 3 dot lengths for a letter space and 7 dot lengths (or more) for a word space. (actually, you have up until the word space time out for a letter to be recorded, so you have to wait a mininum of 3 dot lengths and no more then 7)

If you run your letters and words together, which many do, then the message will not record correctly. Sorry, it's not easy to decode sloppy sending. If you can't record the message properly, you need to work on your timing. Not only will the program copy your code better, so will everyone else!

Steve KD1JV

I have found the timing is a bit critical. I leave a little more space between letters (i.e. don't even come close to running them together). Leave a good long space between words and it will be reduced to a normal word space.

Glad you managed it and solved the problem.
One word of caution.
Do not use straight keys with the PFR. It just doesn't work right unless you are faster than 20 WPM at sending.
Otherwise it starts to screw up your sending.
Use only paddles with it.

Glad you liked the li'l video.

The PFR is a nice radio not perfect but I love it.
Yeap. I recommend it with my eyes closed.

Rob.

Do not use straight keys with the PFR. It just doesn't work right unless you are faster than 20 WPM at sending.

Try cleaning the contacts on your straight key. Debouncing the straight key is a little tricky. Once a switch contact is detected, it waits about 5 ms before starting to look for a switch open. If your key contacts have more then 5 ms of bounce or does not keep a good contact the whole time the key is held closed, it will unkey the transmitter and wait another 5 ms before looking for another key closeure.

Therefore, a key with dirty contacts can make the transmitter sound a bit erratic.

Hola a todos desde San Salvador.

Just put together this small 5 minutes video to keep a record of my little QRP best QSOs.
I am amazed, as a beginner, with what you can do using only 5 Watts, a good antenna and the right propagation conditions.
Exciting DX can be done with little.
No need to spend big amounts of money on huge equipment in order to have fun too.

I know. Many of you have made longer contacts but this video is from a beginner to other beginners.
It is also intended to encourage ham operators to start doing CW too.
If I did it, you can also do it and much better too!!!

Hope you like it.

Enjoy.

Thanks a bunch, Steve, for getting on this forum & giving us some GREAT advice. The PFR-3a is an excellent transceiver & I've really gotten a lot of enjoyment out of it.

I'm just a beginner at CW & I've made a couple of contacts with my PFR-3a. However, a couple of times mine has switched frequencies while I was transmitting, mostly sending slow CQ. It has also gone into a mode where it sends a long string of dits. I was going to troubleshoot these issues to see if they were caused by RF getting back into the rig, since I was using an unshielded end-fed wire antenna when this has happened. I'm also using a straight key. Do you think this problem could be solved by using paddles instead?

By the way, the rig tunes up on most any wire I've tried. That's really cool!

Thanks again for your help & the fun kit.

3640. Missing 20 Meters?

Yahoo group: pfr3_group
Date: 2012-05-13 19:56:01 UTC
From: billetter1
Topic: 3640 Message: 3640

I thought I was done with my PFR3A, when I discovered it doesn't have 20 Meters! With the switches in the 20M position, it is actually on 40M. I never noticed this while it was on the bench, but happened to catch it as I was getting prepared to put the rig in the case. In the 20M position, the display is "030.0" and the band reads 40. When I transmit into a dummy load a frequency meter confirms a 40M signal. When I switch both band switches, starting from the 20M position, they switch like this: 40M -> 30M -> 40M.

Any thoughts on what I did wrong?

Rig seems to work fine other than missing 20M. I have had several 40M QSOs with the rig on the bench to test it out.

Thanks.

I would start with a careful inspection of the board and solder joints starting at the switches and tracing it backwards from there, looking for solder bridges or breaks. If that all looks good could be a faulty switch. It's a mechanical part, it happens.

Also take a real real close look at R30, R31, And R 32... specfically R30... and the switch contacts of S6b. IF S6b is shorted.. the radio will think you are trying to go to 40. And if r30 is shorted.. same effect.

Thank you for the quick responses to my problem. Mike, Dale and Billy B. all said the same thing and you were correct. Even with your excellent directions on where to look, it still took me several passes with glasses and magnifying visor with loupe to finally find the solder connection that had a couple of tiny solder splash tentacles. It was on S6b. A simple scrape with the dental tool and all is well. I now have a 3 band PFR-3A!

Thanks for your help.

3645. PFR-3A Questions

Yahoo group: pfr3_group
Date: 2012-05-24 06:06:31 UTC
From: Jed Petrovich
Topic: 3645 Message: 3645

Hello all:

I finished building my PFR-3A after several evenings and have now made a few on-air contacts. It's really going to be a nice addition to my collection.

For me, kits are fun and challenging to build and I always learn something new. However, I still have a few questions about the adjustments on pages 10 and 11 of the assembly manual. Some of you may wish to stop reading at this point. It's going to be pretty obvious that my kit building is somewhat synonymous with "painting by the numbers".

I don't have a frequency counter or oscilloscope, so I initially just bypassed these adjustments and finished building. I have since purchased and assembled a frequency counter kit from http://www.pongrance.com/. I've never used a freq counter before, so this again is new territory.

When I first hooked up the freq counter while in Cal.r mode and on TP1, it measured 10.001.8. I had no idea how many "clicks" it would take to get to 10.000, so I thought something wasn't right with the freq counter. The freq counter didn't seem to move after several clicks in each direction.

So, I went another route and hooked the PFR to a dummy load and set my K3 to the same frequency. I entered Cal.r mode and started clicking the "tune up" 10 clicks. I checked the output. Repeat with more clicks, check. To make a long story short, I ended up clicking "tune up" 40 times until the K3 meter showed I was on frequency. I have since confirmed with two other hams that my PFR is close or on frequency. Still, I was a bit surprised that I had to click so many times to get it adjusted. Now I'm wondering if this is similar to the experience of others. I'm also want to know if TP1 only emits a signal when the rig is in Cal.r mode. I still need to do the BFO adjustment.

Thanks for reading... any tips will be very much appreciated.

73,

Jed

Hi Jed, If the bfo trimmer hadn't been set to the 1/4 turn point, prior to calibration, it may take that many clicks to get "on freq". However, usually, the number of clicks count outsomewhere near 10 to 20. The number of clicks are dependant upon the crystal. It may be that recalibration will be needed. Many times I will use the signal from TP1 and a rx on WWV, to calibrate, rather than warm up a counter. The signal from TP1 is on 10mhz during calibration. Hope you can get it working FB in time for the ATS Sprint on July 21. Good Luck,

Dale:

Thanks for the reply. I did set the BFO this morning and it was a bit off.
Also found I needed about 30 clicks on Cal.r as indicated by my K3.

However, I'd like to try the WWV method, but it's unclear to me how you
"use the signal from TP1". I'm assuming I'd use my K3, set it on 10.000
("rx on WWV") and somehow adjust the PFR3. I just need a bit more
understanding on how this is done.

Thanks again,

Jed

Hi Jed, to calibrate with WWV, put the radio in calibrate, after setting the bfo cap 1/4 turn from the original. OR since you have it already close.. leave it there.Next, bring your station rx up on 10 mhz in the am mode. With a good signal, (S-5 or better) a short lead may need to be held onto TP1 to get the "beat" note of the two signals, the one from WWV and the other one from the radio. The closer you get the radio to WWV, the slower the beat will be... until it doesn't beat but very slowly. Then click the radio on to the second calibration process for the bfo, to save the osc calibration. ok?

Hi Jed, The short lead connected to TP1 flies in the air, radiating a 10mhz signal to your station rx... and the beat you hear is in the station rx... between WWV and the calibration signal from TP1.You're welcome, and if you have any additional questions.. or your buddy.. just email.. either on the reflector or direct. and if you get a chance.. maybe he can get his PFR3 ready in time for the ATS-Sprint too... on 21 July.. see :
http://ats-sprint.blogspot.com/p/rules.html
Have a great day,

I don't have a frequency counter or oscilloscope, so I initially just bypassed these adjustments and finished building. I have since purchased and assembled a frequency counter kit from http://www.pongrance.com/. I've never used a freq counter before, so this again is new territory.

When I first hooked up the freq counter while in Cal.r mode and on TP1, it measured 10.001.8. I had no idea how many "clicks" it would take to get to 10.000, so I thought something wasn't right with the freq counter. The freq counter didn't seem to move after several clicks in each direction.

So, I went another route and hooked the PFR to a dummy load and set my K3 to the same frequency. I entered Cal.r mode and started clicking the "tune up" 10 clicks. I checked the output. Repeat with more clicks, check. To make a long story short, I ended up clicking "tune up" 40 times until the K3 meter showed I was on frequency. I have since confirmed with two other hams that my PFR is close or on frequency. Still, I was a bit surprised that I had to click so many times to get it adjusted. Now I'm wondering if this is similar to the experience of others. I'm also want to know if TP1 only emits a signal when the rig is in Cal.r mode. I still need to do the BFO adjustment.

Thanks for reading... any tips will be very much appreciated.

73,

Jed

I think there was a thread a month or two ago about the Bulldog paddle
being available for front mounting to the PFR3.

John,

I have a built set of the Baby Black Widows, if you're interested.

Send me an e-mail and I will forward you pictures off list, tonight when
I get home from work.

IMHO, mounting paddles on the PFR-3 is a mistake. I had them on my PFR3 (Thanks Dale!) for about one QSO and then removed them in favor of one of the small paddle sets made by the AZQRP club several years ago. It just doesn't make sense to me to use radio-mounted paddles - especially if they are as difficult to use as the original PFR mounted paddles. Besides, the paddles protrucing from the front of the radio are just begging to be broken off.

Greetings Lee,

The paddles I've designed are so close to the body of the radio that, you would be hard pressed to brake these paddle arms off. Besides the entire base being securely screwed onto the radio case, both paddle arms fold down and against the base. The only way to break the arms off would be to actually pry the paddle arms up and away from the base and then literally, with some very major force, pull the arms out, off of the bulldog clip. What I'm trying to say is that, you would have to WANT to break the arms off.

The second feature of this design is that, I don't need to carry and plug-in and fiddle with a separate paddle and it's wire. All in all, it's a very neat little package. If you were to go to the photo section and look into the KG4BAS folder, you'll see what I'm trying to explain.

Have a great Memorial Day weekend,

Ren

Interesting comment. I have been delighted with the Hendrick's radio-mounted paddles and have been using this setup for over a year. My PFR-3A is used in the home shack but most often out in the field with a Buddipole antenna. Sending speed 20-30 wpm. Just clean the screw contact with a dollar bill once in a while and good to go. On my base rig (TenTec Omni VI+) I use a Bencher paddle or my Kent or my Vibroplex. To each as own I guess. Fun comments.

Mounting paddles is a wonderful thing if you are operating in the field in compromised positions. I can operate with the original mounted paddles standing in the field or sitting on a stump, rock or the tailgate of my truck quite comfortably and honestly I am really pleased with the old original stock PFR paddle. It is light, runs 20 wpm just fine as long as adjusted right and is tough enough to survive in my pack or bag. I have Jeffy's key too and frankly it is heavy and geared more towards operating from a picnic bench. It is a very nice key but it mounts straight out from the rig... if you hold the rig and stand and operate you understand pretty quick why the original mounts at an angle. It really comes down to what style operating you are doing. Good weekend to all and I hope to work some of you for the ARCI event Sunday Night. I will be setup in the field somewhere and stoking the fire with chile dogs.

I have been using Ren's Bulldog paddles on my PFR-3A.
No complains at all. Once adjusted to my likeness they are working fine.
Non obstructive and not bulky at all. They fold for storage, light weight but tough at same time.
Just the right thing for travel or backpacking.

I had the same issue when I tried some with a friends k-1 but I heard some folks
put steel on part of the case to hold the magnets and that it becomes a one handed
operation. I am fairly heavy handed though so YMMV. Somewhere there is a redneck
who has a set jb welded to an anvil.

Dale:

Just a brief follow up... I was able to get my PFR calibrated last night. It was a bit hard to hear the "beat", but it was "right on" according to my K3's CWT display. I'm definitely going to provide some help to my friend when he's ready. He has a hearing problem and I doubt he would have been able to calibrate on his own. Thanks from both of us for your assistance.

This morning, however, I was doing my on-air practice and it appears the PFR drifted a bit towards the end of my QSO. I'm assuming this is normal. Perhaps it would be advisable to work the PFR into my dummy load for a while and then calibrate again?

Another question... I'm getting about 7 watts out on 20m using a gel cell that puts out about 12.5 volts. Should I do something to bring this closer to 5 watts?

Hi Jed, The dds won't drift very far, maybe a temp thing but not a whole lot, even then, unless calibration is accomplished at one extreme then the radio is operated at the other end... but thatis really a stretch. I let the ones here stabilize to room temp, prior to calibrating. Unless I know the owner only uses it outside, and in cold weather constantly. Then I'll calibrate it a bit on the cooler side. But that rarely makes any difference. A check of the components around the dds for cracks in the bodies of caps, might be worth the trip, if it is drifting very much. As for 7 watts on 20.. it is more critical if the current is nearing the limit of the finals.. then decoupling would be called for in the interest of saving the finals during a tuneup or while using an intermittant high swr antenna. The intermittant will kill a set of finals about the quickest, especially if the finals are being shoved to make the most rf possible I like to keep the current limited to 950 ma or so, as measured to the radio from the power supply/battery, at 12v. Good luck with it Jed, and we'll do that Q one of these days, maybe during the ATS-Sprint? Check that at:http://ats-sprint.blogspot.com/ Have a great day, and I'll keep an ear out for you too,

Subject: Re: [pfr3_group] PFR-3A Questions

Dale:
Just a brief follow up... I was able to get my PFR calibrated last night. It was a bit hard to hear the "beat", but it was "right on" according to my K3's CWT display. I'm definitely going to provide some help to my friend when he's ready. He has a hearing problem and I doubt he would have been able to calibrate on his own. Thanks from both of us for your assistance.

This morning, however, I was doing my on-air practice and it appears the PFR drifted a bit towards the end of my QSO. I'm assuming this is normal. Perhaps it would be advisable to work the PFR into my dummy load for a while and then calibrate again?

Another question... I'm getting about 7 watts out on 20m using a gel cell that puts out about 12.5 volts. Should I do something to bring this closer to 5 watts?

On Thu, May 24, 2012 at 6:54 AM, Dale Putnam <daleputnam@...> wrote:

Hi Jed,
If the bfo trimmer hadn't been set to the 1/4 turn point, prior to calibration, it may take that many clicks to get "on freq". However, usually, the number of clicks count out somewhere near 10 to 20. The number of clicks are dependant upon the crystal. It may be that recalibration will be needed. Many times I will use the signal from TP1 and a

rx on WWV, to calibrate, rather than warm up a counter. The signal from TP1 is on 10mhz during calibration. Hope you can get it working FB in time for the ATS Sprint on July 21.
Good Luck,

Subject: [pfr3_group] PFR-3A Questions

Hello all:
I finished building my PFR-3A after several evenings and have now made a few on-air contacts. It's really going to be a nice addition to my collection.
For me, kits are fun and challenging to build and I always learn something new. However, I still have a few questions about the adjustments on pages 10 and 11 of the assembly manual. Some of you may wish to stop reading at this point. It's going to be pretty obvious that my kit building is somewhat synonymous with "painting by the numbers".

I don't have a frequency counter or oscilloscope, so I initially just bypassed these adjustments and finished building. I have since purchased and assembled a frequency counter kit from http://www.pongrance.com/. I've never used a freq counter before, so this again is new territory.

When I first hooked up the freq counter while in Cal.r mode and on TP1, it measured 10.001.8. I had no idea how many "clicks" it would take to get to 10.000, so I thought something wasn't right with the freq counter. The freq counter didn't seem to move after several clicks in each direction.

So, I went another route and hooked the PFR to a dummy load and set my K3 to the same frequency. I entered Cal.r mode and started clicking the "tune up" 10 clicks. I checked the output. Repeat with more clicks, check. To make a long story short, I ended up clicking "tune up" 40 times until the K3 meter showed I was on frequency. I have since confirmed with two other hams that my PFR is close or on frequency. Still, I was a bit surprised that I had to click so many times to get it adjusted. Now I'm wondering if this is similar to the experience of others. I'm also want to know if TP1 only emits a signal when the rig is in Cal.r mode. I still need to do the BFO adjustment.

Thanks for reading... any tips will be very much appreciated.

JedAD7KG

3668. troubleshooting internal BLT

Yahoo group: pfr3_group
Date: 2012-05-27 03:38:51 UTC
From: doublehelix454@hotmail.com
Topic: 3668 Message: 3668

Hello: I have just finished building my PFR-3A kit and all works great...except that there is no power output through the BLT. Using S8 on the coax setting works perfectly - 5 watts out.

Whenever S8 is switched (toward the right) to run the siganl through the BLT, there is no power out to my wattmeter at all. This is true on both low-Z and high-Z settings. It is true for "tune" mode, as well as "operate" mode.

Also, received signals are very poor through the BLT. S11 on the rear panel is always kept toward the coax jack. All of the solder points look good.

I must have screwed up somewhere, though. Any suggestions for the best way to proceed with troubleshooting are much appreciated.

S8 is used to switch between a direct coax connection to the BNC jack or the BLT (balanced line tuner). The Coax position is
of course used if you are using a resonate, coax feed antenna or an external tuner. The BLT position is used when the built in
tuner is desired and is normally used with ladder line feed antennas, Does the led light up, in the blt position? The tuning is very sharp on the blt, can they be peaked for better rx? With the back panel switch pointing toward the coax connector, and the BLT, selected to LOW impedance,This can be done easiest with S7 in the operate position. Then S7 can be switched to TUNE, for the minor tweaks for the tx to match correctly.

Hello Ed,

S11 toggle must be optioned toward the binding posts for unbalanced loads otherwise the coaxial connector is not connected to the BLT.

See ass'y. man. pg. 20 about 3/4 down the page.

Best of luck with your new PFR3A!

3680. ATS4 Firmware Flash

Yahoo group: pfr3_group
Date: 2012-06-03 23:42:53 UTC
From: bob_nelson_k2qpn
Topic: 3680 Message: 3680

I am trying to flash the firmware in a ATS4 (original). No luck. I made a cable per the documentation. Ohmed it out several times - seems OK. I attach the cable and power on the ATS4. If I use workbench and open ATS4ND.prj and then AST4ND.s43, the debug icon is grayed out. If I open the ats4edit.eww file, I can start debug. Debug then complies the code but fails "Can't find device".

Any ideas?

From: john_w3hi
Topic: 3685 Message: 3685

I'm getting ready to build my pfr-3a and am wondering if I need to consider modifying the tuner's range before I put it together. I plan on using a 67' end-fed antenna with a short counterpoise on 40m & 20m, and if it'll tune, on 30m also. Will the tuner be able to handle that or will I need to change some toroid windings, add caps, etc.? An alternative is to shorten the antenna when on 30m to a half wave, but that would be bothersome. Any ideas?

Topic: 3685 Message: 3687

Hi John,

I don't recommend modifying the tuner; it's fine for what it is. The BLT in the PFR3A will handle both balanced and unbalanced loads over a relatively wide range of frequencies, just not over a wide range of impedance. It would be etter to change the length of the wire slightly.

The problem you will encounter with 67 ft. is on 40. The impedance at the end of the wire will be much higher than the PFR3 tuner can handle.

The BLT in the PFR3A will handle both balanced and unbalanced loads over a relatively wide range of frequencies, just not over a wide range of impedance. A better length would be, for example, 51' along with an RF return wire of maybe 16 ft. or so. This gets the feedpoint impedance down to something the tuner can handle. There are other convenient lengths that are non-resonant on the 3 bands of interest.

Best of luck with your new kit.

John,
I use a 65 foot wire and a counterpoise wire about 3-5 feet long.
You need safe cracker fingers but it will tune up very nice on all three bands.

3691. Switch on rear panel with BLT

Yahoo group: pfr3_group
Date: 2012-06-12 22:09:21 UTC
From: k6mgo@verizon.net
Topic: 3691 Message: 3691

I have a question about the rear panel switch.
The manual says under "Using the BLT Note:" "The handle of the switch on rear panel should be slanted towards the coax jack when using either a balanced line on the binding posts or just a coax feed antenna."

I am using a approx 50 foot doublet, center fed with 450 ohm ladder line. I have tried it with a Elecraft dual balun (1:1 & 4:1) and then the coax to the coax jack, and the 450 ohm ladder line directly to the binding posts.

In both cases, I hear more background noise, and can effect a match with the antenna to the PFR3 with the rear panel switch slanted towards the binding posts, rather than towards the coax jack.

Has anyone else noticed this, or am I the only one?

73, Bill, k6mgo

3692. Re: [pfr3_group] Switch on rear panel with BLT

Yahoo group: pfr3_group
Date: 2012-06-13 00:16:22 UTC
From: Steven Weber
Topic: 3691 Message: 3692

If the toggle switch is wired as showen in the manual diagram, having the switch handle tilted towards the binding posts will ground the black binding post and connect the red post to the center of the BNC jack, effectively tuning the balanced output into a unbalanced output.

This will not make a whole lot of difference, except if the COAX/BLT switch is in the BLT position, in which case the transmitter will be driving the output side of the BLT and this will suck up power.

So, when using balanced feed line like 450 ladder line, the toggle should be towards the BNC jack, which should disconnect the BLT from the jack and keep it as an ungrounded, balanced output. A balun should not be needed in this configuration.

If it works better the other way, you might have the switch wired wrong.

Have heard so many great things about the PFR-3's, I today found out about this group, and joined right away.

I've been a ham since 1981, and love CW QRP, but own only a home station...and as of yet own no portable rigs.

Would love to buy a new PFR-3 kit,and find someone who's really good at building kits...as that's nothing I'm in any way capable of doing myself.

Have heard there's a few guys in this forum who build kits for other hams, and would very much appreciate it if you gentlemen would contact me.

The portable bug has bitten me after several recent out-in-a-park sessions of listening to the ham bands with a portable Sangean ATS909 and a 20-foot wire antenna. Making ham QSOs in that setting sounds great!

Hey Tim,I built the kit and I just took my sweet time. I double checked each part before it go soldered and I just used my FT 857 to calibrate it. Dale her know it well enough to build it when he's sleeping and Steve weber will jump in if you have a problem. The rest of the group can walk you through step by step. Trust me. If I built it then you can so go for it. Bob AF2Q

Bob...The last time I tried to do a simple solder, I ruined a piece of gear.

While I find the idea of building my own equipment interesting, I have zero interest in trying again to learn how to do it myself. I've learned my limitations and what I am and am not good at! Building stuff isn't what I'm good at.

The part of ham radio I like is operating...not building or repairing anything electronic.

Appreciate your feedback.

Steven,
I checked the wiring of the rear panel switch, both against the picture and schematic and it was wired correctly. I then tried tuning all three bands on the 50' doublet, center fed with flatline. It tuned up perfectly on all three bands. I then did a test with my favorite test method, that is calling "CQ" and checking the Reverse Beacon Net site on the web for responses. I checked both with the switch in the "correct" position and then with the switch in the wrong position, just to see how much effect it had. The fist station reporting show a Snr of 26 dB with switch in correct position and 23 dB in wrong position. the next station reported 7 dB in correct position and 6 dB in wrong position, and the last station reported 3 dB in correct position and no report in wrong position.

How I got off on the wrong foot here thinking that the switch slanted towards the binding posts with balanced line was better I don't know, but, thanks so much for straightening me out.

3701. Re: [pfr3_group] Re: Switch on rear panel with BLT

Yahoo group: pfr3_group
Date: 2012-06-14 17:49:10 UTC
From: Jed Petrovich
Topic: 3691 Message: 3701

Hello everyone:

This has been an interesting thread... However, it still leaves me with a few questions, perhaps academic for me personally, since presently my shack and portable antennas are all coax fed.

By way of introduction, I've only had my PFR-3A on the air for about a month. (And yes, having fun with it.) In the shack, I have a 3-el SteppIR. I also use a Buddipole (used as a vertical with a raised radial) and a vertical loop from KangaUS. The first two antennas are "tuned" and the vert loop requires the use of a tuner on all bands. Hence, all of my antennas have been fed using the coax jack. On the tuned antennas, I have the antenna switch towards the BNC connector and the BLT switch to COAX. On the third antenna, I have the antenna switch towards the Balanced Line side and the BLT switch set to BLT. Of course, I then tune the BLT using the LOAD/TUNE knobs.

So, back to Steve's reply in this thread:

"So, when using balanced feed line like 450 ladder line, the toggle should be
towards the BNC jack, which should disconnect the BLT from the jack and keep it as an ungrounded, balanced output. A balun should not be needed in this configuration."

Question... If I want to use a ladder line fed antenna, what settings do I use if it needs to be tuned? I would have to assume that I'd set the antenna switch towards Balanced Line and the COAX/BLT switch to BLT and then tune as necessary. Right? Wouldn't end-fed antennas also be set up in the same fashion?

73,

Jed

Jed,

This is exactly what I was doing, and it's wrong. If you use balanced line for feed, to the binding posts, you want the rear panel switch to the coax jack, otherwise you are shorting out the black post, and now have unbalanced feed as well as feeding some of the RF back into the back end of the BLT. You would set the coax/BLT switch to BLT.
End FEd antennas would want the black post grounded, so you would slant the switch towards the binding post and again use the BLT, S8 to BLT.

From: doublehelix454@hotmail.com
Topic: 3705 Message: 3705

Hello All: Hope this isn't too far off topic. I am planning to construct a couple of small EFHW antennas, as described on the EARC homebrew page <http://www.earchi.org/proj_homebrew.html> for use with the PFR 3A and other radios. These projects call for a T106-2 toroid to be used. I do not have a T106-2, but do have several T80-2. In order to fit the prescribed 25 turns of wire onto my smaller toroid, I would have to double back over the first layer of windings a bit. How will this affect the inductance and performance? Thanks for your help.

The T-80 will work but inductance will depend on wire size and the spacing of the windings. I built the SOTA end fed tuner but went with a T-68-2 core and 16 GA wire. I'm not home now so I can't bring up the site you have here. Bob AF2Q

Hello Ed,

Since that "match box" is actually an 'L' network, you will need to maintain the value of the inductor when changing core sizes.

According to Mini Ring Core Calculator, 25 turns on a T-106-2 core is approx. 8.2 - 8.7 uH. For a T-80-2 core the same inductance would be 39 - 40 turns. If you have or can procure some #24 gauge enamel wire, it will fit the core. #22 will fit also but not the plastic insulated wire in the photographs.

In a pinch you could also strip the insulation from the #22 wire and use it bare; the toroid core is non-conductive although you would have to ensure that nothing conductive touches any of the turns.

I should have also said that none of the turns of bare wire on the toroid can be allowed to contact one another.

..."the toroid core is non-conductive although you would have to ensure that nothing conductive touches any of the turns."

Hello, Ed

I think the inductance requirement can be met, but you will definitely have more intrawinding capacitance because of the two layers overlapping. I am not sure if that will be a severe problem or not.

Winding with bare wire as Steve suggested will not work unless the wire has enamel insulation. You can not allow adjacent turns short to one another. That would ruin the inductance for sure.

Hi Harlen,

Yes, you are correct; as I stated in my posts, if adjacent turns touch, or anything conductive touches a turn or turns, bare wire will not work.

Other than that, when wound on coated powdered iron toroid cores, bare copper wire will work. However, I certainly wouldn't recommend it over properly insulated wire.

Regarding the 'L'-network "matchbox" in question, even at QRP levels, the core coating may withstand the potential at the L-C-Ant. node. If bare wire were all I had on hand that would 'comfortably' fit the core, I'd certainly try it.

As I stated, bare copper wire will work OK "in a pinch" but certainly not under all circumstances.

Just as a matter of curiosity, as long as the PFR3 has a built-in tuner, and Bob AF2Q and John W3HI, among many others, have had good luck tuning a 65-67 foot end-fed random wire,(see posts a few posts back) I'm wondering how that would compare performance wise, to the single band end-fed 66 ft. wire with the matching transformer referenced below? It would seem to me, that a 65-67 ft. wire is a same, if the matching ckt. is inside the box or outside of it. Once you match the wire to the rig, you are going to get the same amount of radiation from the same length of wire, as far as I can see. Am I wrong here?

Hi Bill,
I have made the A/B test.
I used half wave wire for the bands I wanted to work and they tune very easy even on the pfr3.
But when I switch over to my end fed that is 65 feet long and almost vertical I received much better reports.
I just use a random wire about 4-5 feet long as a counterpoise.
I don't remember where I read it but one ham used the 31 foot telescopic pole and put his rig right at the bottom of the pole.
Then he tied kite string to the end of the remaining wire and heaved it over a tree.
To high he said because it was angled about 20* up
Well he tuned that and he started working so many station and at one point he had DX pile up on him.
They to shoot the guy to get him home:-)

The more wire you can get up high is the best and cheapest way to go and the pfr3 will be heard

Thanks Bob,

That's kind of what I thought...You don't need all of the special extra tuning toroid ckt's and all as long as you have a good tuner already in the rig. As you say, getting more wire, high up is the key to it all when it comes to antennas. It's just a waste of money, and the fact that you have a single band antenna, doesn't make sense to me, when you can put up a long wire, and have a multi-band antenna.

I'm not much of a contester, but been having a ball today with the PFR3 and my indoor doublet, giving out contacts to the Field Day guys.It's wonderful how most of the time, unless you're 20 over S9, so many guys won't come back to you, but let a contest be under way, and they'll work all the stations they can, even if you're not that powerful. Hi Bill,
I just got in and being it is dark I ran the 65 foot of wire from the rig out the window and tied the end to a bush.
That pfr3 has good ears and puts out more then 5 watts.
I'm hearing a lot of CW and considering how bad the bands are in in NJ and hearing good copies from W8,W9 W5 so I'm leaving that wire out for the night and later see what DX I can work.
That pfr 3 has a final for each band and I like that.
I may have heard it here but not sure.
A ham has a check in net on 7114.0 + - for any QRM.
He gave me all the details but I have to dig into my old mail and see if I still have it
If I find it I will post it here,.

Hi Ed,

I've been using the Reverse Beacon Net for doing my A/B tests, and find that it works the best for me. In case you don't know what I'm talking about, just call CQ and your call, (3X3 call best) and then go to their website, and do a search on your call. It will show all the stations that copy you, and give nice report, including SNR. Then switch antenna's and repeat. You can compare the SNR, many times from the same station. You have to move freq a bit, or they wont send a second report, but, just move and then you're good to go.

Hi Gang,
I was goint to question that last night but I don't know enough about the skimmers.
I started thinking that maybe one skimmer has an antenna tat is set up so it receives very well from your area.
One person may have a low antenna and another skimmer may have a very high antenna.
I can guarantee you that if a ham tells you he is picking up a beacon but it's very week then that pfr3 will hear it.
But there is a beacon in Russa on 7.039.0 and I have not been able to hear it and hams in my area with big wire antennas have not been able to hear it either.
Any way these RBN and A/B testing are a lot of fun.

It depends on the area you live in of course, but if you live in a populated area, as I do, you will get more than one skimmer reporting your signal. On 40 meters I get CA stations and UT and Co stations reporting. On the high bands, 20 meters and up I get the east coast, Hawaii, and med-west reporting. Gives you an idea of your signal strength as well as radiation pattern. Very handy tool to use to see what antenna works best for you. I built the end-fed half wave 40-6 meter antenna that was mentioned here awhile back, and on 40m it is 10 dB lower than my indoor doublet in the rafters of the garage. On 20m and above, it is about equal to it. So you see, it can come in very handy to compare antennas.

Other Hendricks kits have the 10uf cap installed. The BitX17A & BitX20A for example while the dual bander and the PFR3A do not.

It would increase the noise from the 386 but would be worth a try.

Yes and yes, -but-, other than buying the most sensitive earphones you can find, it is the easiest and most economical mod. you can make to boost the audio.

The gain of the LM386 is 20x with no capacitor, 200X (!) with 10 uF capacitor and ~50X with a 1.2K If you find the gain too high, place the resistor in series with the capacitor. Adjust the value to your liking the replace with a fixed resistor.

I have posted the LM386 datasheet to the "Files" section. You can find the above referenced information plus the curves for distortion and current consumption.

Saw Ren's paper clip paddle in the photo's and tried to find an email for him but couldn't so Ren if you see this, I sure would like to know where to find the plans to build that paddle if possible.

I've found that having good earbuds is great, and the next thing is an external audio amp. It can be a LM386 battery powered, or an ipod amp with speakers. lots of them about. But the best is the higher impedance earbuds. Good Luck Bill.

I just got a neat little amp to plug in series between the PFR3 and my headsets called a Boostaroo Revolution, it's 3 1/2" X 3/4" X 7/8" and all self contained, battery included. Works well and gives just enough volume gain to bring out the weak signals. I also hooked up my old New England QRP Club Scaf filter, which has a 386 amp chip in it, to the PFR3 and that works magic in filtering out my S5-9 noise level as well as boost my audio. I had forgotten about that puppy.

So I guess my audio problem is solved, and I want to thank all who gave suggestions and advice.

Hi Bill,
I picked up that audio amp kit from Morse Express for $8.99.
I also took 2 older RS speaker AMPs,removed the speaker and cut the board and remounted everything much closer
They both work excellent but like you said you just can't beat the NE/scaf filter with the audio amp.
I still think for my ears you can't beat the ear buds made by Phillips.
At times you can get them on sale for $9.99
Have fun.

Hi Bill,

Glad to hear you resolved your audio problem.

I too had forgotten about the NEScaf. That is the perfect application of that device (ear/speaker audio out to SCAF) providing not only audio filtering but additional audio gain to boot.

Out in the field I would prefer the internal 386 gain mod. instead of an outboard amplifier. Less things to carry plus the bother of another battery to worry about and/or forgetting the audio connecting cable cable, etc..

One time I used a Radio Shack 'Mini Audio Amplifier' (cat. # 277-1008) out in the field with the PFR3. While it did provide a gain improvement, there was additional noise and distortion. I think the RS amp. runs its LM386 'full-bore' and could stand the resistor mod. to throttle it back some along with other mod's decrease the 'hiss'.

A lot of interesting comments regarding an external amplifier George. While I commented earlier regarding the capacitor mod I must say that I too am hard of hearing, loss clear down to 1,800 Hz. and always wear hearing aids but I have no problems with the audio output from my PFR-3A using either Apple or Sony earbuds. Plenty loud on any useable signals.

I would not want to have an additional box to connect to the PFR so my choice would be either more sensitive earbuds or the internal capacitor mod.

I hear what you're saying, Steve, and if I would get out much with the PFR3, i would not want to be carrying any extra gear or equipment either, but around the house or on the patio, the NEScaf really helps with both the audio, and my ever present S5-9 noise level. Out in the field i would prefer the Boastaroo as it's very tiny and doesn't take up hardly any room and doesn't weight but a few ounces.

And Michael, my hearing stops at 2K also, maybe from all the mornings of doing a preflight on the radios in the T-6's and B-25's while the crew chief's were doing their engine run ups, we had 50 aircraft being preflighted all at once,in our squadron, before dawn. You get 40-50 aircraft checking out their engines all at the same time and that's a lot dB's of noise:) So, guess we're lucky that the cutoff for us is above the CW tone.

I had kinda thought of combining the NEScaf with "An Automatic Audio Volume Leveler" (AGC) by K1QW in Feb. 2004 QST. Seems that would make a good addition but it would be external to the "yellow box".

That's sounds like a worth while addition, Paul. I've been eyeballing the inside of the pfr3 and my NEScaf filter, and as far as I can see it would be no problem putting the ckt. Bd in the pfr3 case, but the controls are another thing. I have my Palm Mini paddle mounted to the case on the left side, which would have been a pretty good place to put the controls, but now I can't and also Labeling the controls and switch would be a concern, as I would want that to match what is already on the pfr3. So, think I'll leave the NEScaf filter out board of the pfr3 for now.

Have a Happy Fourth,

I added the 10uf capacitor a while back. It seemed like it made the audio a bit unstable. The rig would howl for no reason. Sometimes a strong station would suddenly set it howling. Perhaps it needed more PS bypassing near the audio amp. Eventually I took the capacitor out.

I then found that the quality of the earbuds was really important. I found some fairly cheap ones at a local computer emporium that made a big difference. Thinking about adding a battery amp for a speaker so others can hear.

My PFR-3 also had a howling but I determined it was humidity. I sprayed it with Krylon and have not had the issue return. Only showed up when in the field and in a humid local like North Carolina and Alabama. I have the 10 uF and it works fine.

3749. FOXHUNT !!!!

Yahoo group: pfr3_group
Date: 2012-07-05 01:32:14 UTC
From: Dale Putnam
Topic: 3749 Message: 3749

For the second week, the FOXHUNT is up for fun. AB9CA and I (WC7S) will be your FOXii for the evening.
14.060 plus or minus 10... and 0100z or on7pm MT ... We will be exchanging information including Signal Report
- QTH
- Operator's Name, and
- Power Output I'll be using a Hendricks KD1JV design Tri-bander, with a 100 ft center balanced fed doublet at 50ft. IF the band drops out and I need to change to the long antennnas, I will. The plan is to WAS with the Tri-Bander this season, I am also planning to use a puter logger, to assist with keeping the calls straight. Not that that is a garuntee.. but may be worth an effort. I will be tuning with RIT, around the edges of the pack, using the analog filter from Elecraft if I have to. So spread out and lets do it!! CQ FOX up.. dwn.. or nothing.. listen close. Good Luck!!

Hi Keith, I think it was from the naming convention... AT radios... vs KD1JV designed.... maybe, if we get enough participation.. that can be corrected for next time.

Dug out an old battery speaker pair. Seems to work very nicely. But it also adds more stuff. Oh well. I have a good pair of earbuds (which is really necessary) and the speakers for when folks need to hear.

Still love this rig.

Topic: 1 Message: 3757

I am happy with the audio volume of my PFR-3A.
What I really don't like is that it lacks a good AGC.
The band noise can suddenly pick up so sharply that may damage your ears!

In order to save my ears, I ordered this small battery rechargeable speaker that has provided hours and hours of fun protecting my ears:
http://www.macobserver.com/tmo/review/the_genius_mini_portable_speaker_sp-i150/

I can run on batteries without recharging them for more than 2 hours of continuous use. Small and portable. You recharge them with the USB port of your computer or you can use a small battery USB recharger.

Forgot to mention... sound is amazing and covers 360 degrees.

This is has worked for me. My two cents.

I have a box full of the RS speaker so I just use that and the 9 volt batteries at the dollar store are $1.00 for 4 batteries but they will last a full day.
I also have the audio AMP kit here that Morse express sells but I haven't had time to put it together.
It will be in a small box between the ear buds and the cord that plugs into the rig

3763. Warning.

Yahoo group: pfr3_group
Date: 2012-07-20 20:16:57 UTC
From: k6mgo@verizon.net
Topic: 3763 Message: 3763

I just came across a very strange thing while checking the power output on my pfr3.

I wanted to check the power output from both internal and external batteries. I started with internal batteries on 20 meters, into a dummyload and rectifier. I had normal power out. I then moved both band switches down to 30 meters and read about half the voltage across the load as normal. I then moved the band switches again, to 40 meters and had almost zero voltage across the load, key down.

I then checked it with external power and about half voltage on the load on 20 meters and no voltage on the load at 30 and 40 meters.

I then turned the power switch to "OFF" and then changed bands before re-applying power, checked voltage across the load, and it read normal for >4.7 watts across the load for all bands.

It seems that for some reason, changing bands with power applied causes there to be no or little power out. If I turn off the power, and then change bands and then apply power, it works normally.

I have no idea why this is happening, but would advise you to check your pfr3 also to see if you have the same problem.

I had the coax/blt sw. in coax, the Z sw. in Low and the back apron sw. handle towards the coax conn. Both sets of batteries were up to full charge.

73 de k6mgo, Bill

Bill,

The toggle switch must be optioned toward the binding posts when measuring power through the coaxial connector (or when feeding an antenna directly or using an external tuner). Otherwise the BLT is across the load even though it is disconnected from the transmitter by S9.

If that's true Steve, than I have a problem. I just checked it out with the toggle sw. towards the binding posts, dummy load on coax, Tune/Oper to Oper, Coax/Blt to Coax and "Z" to Low.

Leaving the power on (Ext) and changing from 20m (10.56V on dummy load) to 30m I got 6.28 V on load, and on 40m 0.012 V.

Turning power off and changing bands to 20m from 30m I read 10.52 across load. Turning off power, going to 40m and toggle still towards binding posts, I read only 6.28 V. Changing only toggle sw I get 10.50 V again.

I'm entering here a bit late, but I've seen this happen, only once... and that can be duplicated quite easily. Do the set up like Bill has done, and change bands, read the power.. change bands, read power... problem.. in my case was caused by NOT unkeying, and letting the microP set up the radio. I've seen similar with bad switches or bad soldering under the switches for band changing.. but the symptoms are different. Bill, I would be very happy to check that radio over for you, if you want.

If that's true Steve, than I have a problem. I just checked it out with the toggle sw. towards the binding posts, dummy load on coax, Tune/Oper to Oper, Coax/Blt to Coax and "Z" to Low.

Leaving the power on (Ext) and changing from 20m (10.56V on dummy load) to 30m I got 6.28 V on load, and on 40m 0.012 V.

Turning power off and changing bands to 20m from 30m I read 10.52 across load. Turning off power, going to 40m and toggle still towards binding posts, I read only 6.28 V. Changing only toggle sw I get 10.50 V again.

Hi Dale,

You just solved my problem. When I left the power on, and changed bands, I also had the the keyer in "T" mode so that I could get a steady key down reading on my DVM across the load. I just checked it again, leaving the power on, but, taking the keyer out of "T" mode, and I got full voltage across the load on all bands.

Who'd thunk? :)

3772. ATS-Sprint coming up soon!

Yahoo group: pfr3_group
Date: 2012-07-21 02:52:00 UTC
From: Dale Putnam
Topic: 3772 Message: 3772

It's less than 24 hours away, and sure there will be some competition on the bands.. and that is ok.. yes, it may get frustrating, and somewhat tiring to have to work around... but you know what? If it were really easy... it wouldn't be a challange... and we all like challanges, right? So, here's one for you.... I challange each of you... to get on.. and have some fun... participate in the very first ATS-Sprint. Just do it. I will, I think I will work every one of the radios I have from Steve... each one.. no.. not at the same time... but that would be fun too.. put one on each band...hmmm... I could get them swapped into operation more that way... ... aw... just swapping radios is probably easier.. and less likely to screw something up. SO.. if I tell one of you one radio.. and someone else another... DON'T change the first entry in your log. And if I give each radio its own fair share of airtime..I'll be swapping every half hour. hmmm... I better get that arranged well... so I don't lose much time swapping. Ok.. I'm almost ready.. are you? See you in less than 24 hours.. (let's see... "cq ats, cq ats, cq ats... " yep, that works) Good luck

Hello,
I'm in need of 2-3 XTALS at 7.035 on down for a Pixie for a DX friend.
I sent him 2 kits and I told the person to make sure he has the 7.030 XTALS but they were sent with the 7.040 XTALS.
Their usless to him because the Russian Beacon in picked up at 7.039.0.
If anyone know where I can buy a few,please let me know.
Thanks

3776. Rotary encoder kit for PFR / MTR radios - shipping and delivery

Yahoo group: pfr3_group
Date: 2012-07-25 13:04:40 UTC
From: Petr
Topic: 3776 Message: 3776

Hello folks,

according to last talk to Miroslav (Rotary encoder kit father) there are still coming some orders/payment with improper kit prices. As I even found on the internet few of the kits for sale for the higher price and I decided to re-post the original message from Miroslav to avoid mismatches...

"Hello,

I would like to inform you that the kits of rotary encoders for are ready. The price remains the same 25 USD for one kit. The shipping cost is 5 USD for one kit, 6 USD for two kits and 7 USD for three wordwide. You can send the payment to my Paypal account diy4funatgmaildotcom ...

As same as the PFR-3 also all of the ATS series are compatible. The new MTR radio also supported. Please put the note for which radio You are ordering for...

If you want to send the kit to different address than you have in your Paypal account, please let him know either in payment note nor in email."

I hope that it will help You.

3777. Fox FOXHUNT Thurs evening

Yahoo group: pfr3_group
Date: 2012-07-25 13:16:15 UTC
From: Dale Putnam
Topic: 3777 Message: 3777

Dave - N1IX and I will be your FOXii for the Hunt Thursday evening 7pm MT, or Friday morning, at 0100z .We will be between 14.050 and 14.070 for the fun-est 90 minutes in radio. (No.. I didn't flunk English, it's called author's privilege.)Come and grab a pelt (Qso) with fox and enjoy testing the prop princess.. and her moodiness.We exhange RST-State-Name-Pwr (5 watts or less). I'm thinking about using a 9v transistor battery with 5 watts out, to any of the antennas, including 3 - 360 foot doublets at 50 foot, a vertical on a 1:12 pitch roof, or a 100ft edz at 40 ft.a switch allows quick selection to maximize the effect of whoopin' up on the prop princess. (yeah, I know.. another A.P) So.. let's all gather round, have a blast, and swap tails of the chase.. or would that be... the tale of the chase..... ??? Good Luck to all and to each a fresh plucked pelt. check the rules out at http://www.qrpfoxhunt.org Have a great day,

3778. ESD mats portable set for safe soldering

Yahoo group: pfr3_group
Date: 2012-07-25 16:50:36 UTC
From: Petr
Topic: 3778 Message: 3778

Hi all,

I would like to share my experiences with ESD mats for safe, ESD protective soldering as it can help to others. I looked for long time on the eBay and other shops for possibility to purchase small portable ESD mats including the cables to connect for same el. potential or directly to common ground.
All mats I found were big and expensive or small but expensive or small, not high quality and expensive etc.

Requested parameters were: two layers, oil, grease and solvent resistant, high temp resistant, acid proof and knife cut proof material.

After long time I returned back to Czech market where I found the company where they has exactly what I looked for but unfortunately the mats are too big. Standard size is 80cm x 160cm for high price dedicated for professional industrial usage. So I tried to call them and they promised to cut it for me to preffered size 40x60cm and install the cables and bananas for ground connection. We also reached after some phone calls excellent price. Total price is finaly $25 including all h/w.

Parameters:
- thickness: 2mm
- RTG = 10^6 ☐ 10^8

ESD Rubber Mats have two layers; the top one is a blue static dissipative rubber layer laminated to a black conductive rubber bottom layer. Surface resistivity of the top layer is 106 ☐ 108 and bottom layer is 105 ☐ 106. This ESD Rubber material offers excellent resistance to oil, grease and most common solvent. These ESD Rubber Mats are very light compared to our single layer and three layer mats. Temperature resistance to 2000F.

The link is over here:
http://kitman.eprodavac.cz/prenosne-esd-pracoviste-sada-18/

Do not worry about the Czech language of the items description in the e-shop.

If You would like to get this ESD mats then let me know I am ready to help You with purchaisng and shipping to you worldwide.

Hope it will help to some of You as same as to me safe soldering in the kitchen property...

73 - Petr, OK1RP

Topic: 3778 Message: 3780

Hi all,

as I got few emails with questions if it is possible to buy the ESD mats about which I talked in last post and ship them overseas so I am sharing the informaion here again to all...

Yes, I am ready to help with that. I can order them and pay on the e-shop localy. I will re-pack and make the all admin for shipping it to anybody overseas.

The price is just $25 for complete high quality ESD mat including the cables and connection/gnd points as You can see in the link. For payment to me Paypal is ok.

Just drop me an email to indians@... and I will send You quickly the shipping cost and total. It should not be excessive I guess.

My best regards,

To everyone who has a loved one (a wife or significant other). I was present when Doug advised us his otherwise very responsible wife had not had a mammogram or checkup in over 20 years and had just found out she had breast cancer. He very sadly asked us to check that our family members are doing the right thing and getting their exams. I am a family physician and in my last 40 years have seen the great improvement in our outcomes when cancer is found early. It used to be "God's will" when someone we loved came down with cancer and died but that was before all the testing was available and the many support networks became available for even the uninsured. The simple mammogram and an educated breast exam along with self exams are very helpful. And even more important, no one should ever die from colon cancer. Colonoscopies are available everywhere and they are even free here in northern Michigan if you don't have insurance. One has a
window of 10 years before a colon polyp (the lesion that can be removed during a colonoscopy) becomes and actual cancer so get it done now.... please!

Dr. Dave:

Thanks for the encouragement. I was able to meet Doug in person this year at Visalia. I was very sorry to learn of his wife's passing and even more so learning that it might have even been preventable.

My wife and I are both up to date on our exams. It certainly brings some peace of mind when the tests come back negative. Any discomfort encountered before or during the tests is well worth it.

From: n8xx@...
Date: Mon, 30 Jul 2012 13:38:11 -0400
Subject: [AT_Sprint] QST QST QST UPDATE - Team members still being solicited for NAQP (CW) August 4/5

UPDATE: We now have one full team of five suckers... errr. volunteers for the "AT-Sprint Team #1". The latest sucker... errr, volunteer is Doc, K0EVZ. While this rounds out the first team, the NAQP Rules allow for an unlimited number of teams. And, occasionally, personal or business commitment interferes with "the best laid plans of mice and men." So, I'm still looking for additional suckers... errr, volunteers who would like to be a part of this (motley{?}) crew. If we have six volunteers, we'll break into two teams of 3, if we have 7, we'll have one team of 4, another of 3, et. cetera. If we have 20 volunteers, we will enter 4 teams of five. So, please don't be bashful. You needn't be a die hard contest op, you needn't put in a full 10 hours (i.e. "part timers" are fine). There will be plenty of entrants to the contest, so you shouldn't run out of contacts.

The roster for Team # 1 is N0EVZ, NS7E, WC7S, AA4GA, and me (N8XX).

As a reminder - We're looking for operators who have at least one rig designed by Steve, KD1JV, such as the AT-Sprint series (AT-Sprint, AT-Sprint-2, AT-Sprint 3, 3a, 3b, AT-Sprint 4), the Portable Field Radio (PFR), Mountain Top Radio (MTR), and several more. The NAQP uses 160 thru 10 metres (No 60 metres nor WARC Bands). Most activity recently has been on 80 thru 20 metres. We'll be competing mainly with 100 watt ops - there will be a few "practicing" with their "full gallon" stations, but they won't be in the competition. This year the contests runs from 1800Z August 4 to 0600Z August 5, 2012 (First full weekend in August).

Rules for the NAQP are at http://www.ncjweb.com/naqprules.php

Please advise if you're available. I'd like for us to put on "a good old college try" in this event, and show the "big boys" what

QRP can do. Personally, I never cease to be amazed what 5 watts to a modest antenna can do in such competition.

3784. ESD mats portable set for safe soldering - shipping cost

Yahoo group: pfr3_group
Date: 2012-07-31 09:47:35 UTC
From: Petr
Topic: 3784 Message: 3784

Hello,

upon many requests I decided to share over here the shipping cost and totals for 1pc/2pcs of the ESD mats sets:

1pc of ESD mat portable set

Economy mail service (6-8weeks) worldwide: $13 shipping / $38 total to Paypal (incl. shipping, packaging, insurance, handling, Paypal fee)
Priority mail service (3-4weeks) worldwide: $17 shipping / $42 total to Paypal (incl. shipping, packaging, insurance, handling, Paypal fee)

2pc of ESD mats portable sets

Economy mail service (6-8weeks) worldwide: $19 shipping / $69 total to Paypal (incl. shipping, packaging, insurance, handling, Paypal fee)
Priority mail service (3-4weeks) worldwide: $23 shipping / $73 total to Paypal (incl. shipping, packaging, insurance, handling, Paypal fee)

*the mats including the all h/w will be rolled up, wraped and packed carefully into the bubble wrap envelope.

Payment

Use the Paypal payment to: nostalgia.radio@...
Please mention in the comment the mail service choice.

Shipping

After receiving the payment I will order the batch of mats sets. Delivery to my QTH according to last phone calls to supplier is 2-3days.
Immediately after I will check them, re-pack upon requests, fill the customs paperwork and will shipp to each of You.
Each payment will be confirmed by separate email to You as same as the shipment of the package including the tracking number and link to tracking web page.

My best regards,

73 - Petr, OK1RP

Hello all
Do you know if there toujour a manufacturer for the case of
DCxxb series? I know I'm not on the good list, but the list of equipment I asked the question several times
and I have not received a response.
This case was very well built, it is difficult to do as well and as accurate and as solid.
The option with the 4 quarters, with the circuit board is also extra ordinary,
really leaving as small a 1 W with an electronic keyer, it's hard to beat .
I added a capacitor to VXO and tweaked , but I'm really satisfied.
This is the case that blocked me and I would also build a version 18 Mhz

I just got one of those little Radio Shack mono speaker amps. Its not much bigger than the speaker that I was using. Sounds fine with lots of volume. Needs a 9V battery. I'll be trying it this weekend.

FYI

good evening
I think the case can make a case that has resonated
and it is not necessary to drill holes
Otherwise, you know that a 1mm gap of 4 cm in length is more easily done with a drill and a disk,
as small holes, and it is a good filter BF. The speaker stuck just below the slot in the housing

3788. Re: ESD mats portable set for safe soldering - field test

Yahoo group: pfr3_group
Date: 2012-07-31 17:00:35 UTC
From: Petr
Topic: 3784 Message: 3788

Hi all,

today I got my ESD mat from the supplier so I decided to make few tests and share it with You to provide You as much as possible technical information and specs...before decission for ordering it.

The size of mat is 40x60cm as described.
The tickness is 2mm as described (2-layers).

I tested several oils, greases and different solvents and mat survived without any damages.

I tested the flare-up point and it seems to be higher than 1000 C which is corresponding to almost 2000 F. (I was limited by temp sensors and thermometer over here)

I tested the burning thru temperature and it survived 450 C for 2mins which is corresponding to 850 F. (I was limited by my soldering station, hi)

I tested the max of the temp without any noticeable damage of the top layer. It survived 200 C for 2mins which is corresponding to 400 F.

Finaly I tried to cut it using standard knife and make the hole thru using drill and it proved very high resistance.

All these tests results are so great that I am really happy with this new ESD mat and I am sure that it will make great job (for that price) and help a lot to all of You who will order it.

Subject: [AT_Sprint] Last Call, volunteers for AT-Sprint Team members, NAQP, August 4/5

WE now have the following suckers, errrr, volunteers for "AT-Sprint"

teams for the North American QSO Party CW (NAQP) this coming Saturday.

The event starts at 1800Z Saturday, and runs until 0600Z Sunday.

The members so far are: NS7E, W0EA, AA4GA, N6OSB. WC7S. N8XX

K0EVZ had to bow out for personal reasons. We will miss you Doc, and

understand that other obligations get in the way of hamming from time to

time.

Full details of NAQP are at http://www.ncjweb.com/naqprules.php

We have room for as many suckers, errr, volunteers as can have their

arms (or legs) twisted to join us..

As I said before, the only requirement is that you have, and agree to

use, any of the several rigs designed by Steven Weber, KD1JV (AT-Sprint

series, Mountain Top Radio, Portable Field Radio, etc.). You need NOT

operate the full 10 hours allowed (but give it the "olde college try" if

you're part time).

I'll wait until tomorrow (Saturday) at 1200Z (8 a.m. EDT) for suckers,

errrr.... volunteers. Please let me know your availability.

Hi all,

while listening on 14110kHz on battery power my PFR died all of sudden on its own. It's been working fine for several months. Display is gone, and no sound.

The 5V regulator gets very hot and the voltage on the 5V side of it is just 3.2V. When Atmel processor is removed, the voltage rises to 5V suggesting something wrong with the processor or then something behind it is shorting I guess.

Any thoughts, ideas or similar experiences?

Hi !
I had the same experience some years ago, the 5V regulator became hot and the rig died. what did hapen to my rig was a broken U8 after about 30 QSOs.
I might not be so in your case but its a simple check to do before starting to desolder a lot of components.

Hope you get the rig on the air soon

Thanks for comments. U8 ruled out, all good there. Also L7 removed, but the issue remains.

As I see it, it is a problem in the 5V feed only, and as when CPU is removed there is no issue. I'm pretty convinced now that the CPU died - still need to try to figure out why before installing a new one.

Is the code available anywhere should I want to try to program that atmel myself?

Cheerios,
ZL1KLP - Riku

Hello all
I just saw the pictures of CT1BWW to built the pfr3.
Ah, what fond memories this circuit and the latest finish, this is an amazing adventure that I recommend to all.
My pfr3 is equipped with an internal battery 2 x 3 cell Li-Ion battery and a switch to select battery charge
or external battery power by a foreign classic.
and perhaps an power amp. and speaker inside
I see the little switch caps that I've never had, I do not know if they are special for the little switch,
maybe I will buy them at the same time if I order parts from Doug

Well since Steve is on vacation, what low priced rig would you

recommend building for the time being? I was looking at this rig, but

I don't need SSB:

http://kd1jv.qrpradio.com/ARRLHBC/ARRL_MMR40.html

I already own a FT-817. I was looking into something that was

smaller and more compact that I could run off of a solar cell and a

ultra capacitor. If I want to get really alternative, I could have

sterling engine run a small D.C. generator too.

Regards,

Chris Maness

From: full_30dbm
Topic: 3799 Message: 3806

Atmega48 arrived yesterday in mail and I succesfully programmed it with the assembler file found here (thanks Bill). That also fixed my PFR3A and I'm on air again =)

Procedure was:
1) load the PFR3A.ASM assembler file from the files section
2) use AVR Studio (free of charge from atmel web site) to compile it into hex file
3) find ISP programmer (easy to make one yourself if you are into Arduino stuff)
4) use avrdude to copy the hex onto the flash of atmega48
5) change the atmega fuses so that the internal clock is 8MHz and no divider
6) now that this works again, find from Doug's qrpkits something else to tinker with

Hi

Anyone as idea where i could purchase the krylon acrylic clear matte finish 1311 to complete the PFR3 Enclosure

I have here FLYCOLOR ACRYL BASE lacquer, but I'm affraid it will work.
I can't found a store with KRYLON
Thanks for any reply

Hi Marq, You might spray a bit of that clear finish on a cotton swab, then dab in onto the inside of the lid, in a place you can see well. Let it dry completely. See if there is an issue with it. I would be surprised it if isn't workable. Be careful to remove, or not install the red dial cover before spraying tho. It won't like the clear coat.

Your welcome Manuel.
De nada Manuel.
I used another clear coat product and worked well. Not exactly Krylon but remember it was also a spray one.
Had to let the decals dry well first and also let the clear product dry well between coats too.
It worked fine. That was my experience.

Un abrazo.

72 de Rob.

3815. FOX: Good MORNING FoxHunters!!

Yahoo group: pfr3_group
Date: 2012-08-25 16:51:05 UTC
From: Dale Putnam
Topic: 3815 Message: 3815

It is a wonderful day in the life of a foxhunter!... Yep. Sky is blue, not very many clouds, the temp is 57 and rising, the breeze is too much to paint the house, and I have time to work on antennas, and scan the foxpage..... Did you see that NK6A just barely squeeeeeeeked by K4BAI for the TOP FOX... and there is only one week left..... to hunt in... and only one more log to score.. then this last week will be posted too... As it stands now tho.. with two weeks left to post... Don is on the top of the Fox Den Standings. Now how about those Hounds????WOW!... NK6A is holding the top spot for Hounds too! But there are 6 Hungry Hounds nippin and yippin at his heels.... Not nary a slip can he afford. Better come check out the excitement, and watch this coming Thursday... as the Hounds close in... and the Foxii... slip slyly through the woods.... It's going to be a 90 minutes exciting close to the season. And remember we have a no fire ban in the woods... so watch out for sparks, arcs and no flame throwers allowed, in the last hunt of the summer of 2012. Good Luck to all and to all a Good Hunt!!

--... ...--
Dale - WC7S in Wy and there have been 949 pelts handed out with two weeks to go... can we break 1300 pelts this year? Bring your friends along, bet we can!

3816. Finish my PFR3 , but not safisfied with output power!

Hi ,

Finally I finish my PFR3.
Here results with 12,5 Volts
20 Mts - 1,75 watts
30 Mts - 2,92 watts
40 Mts - 5,75 watss

Any idea where i can get 5 watts on all bands, perhaps moving the turns on Toroids filter, i'm right?

Thanks in advance for any possible comment.

Yes Marq, squeeze or spread the band filter toroids to adjust for correct power out. Watch the current being drawn at the same time. Do not exceed 950ma. You may find that squeezing one and spreading the other yields the best power to current ratio.Good Luck,

3819. ESD mats portable set for safe soldering - all shipped

Yahoo group: pfr3_group
Date: 2012-08-27 10:23:06 UTC
From: Petr
Topic: 3819 Message: 3819

Hello all,

Just FYI...

I would like to inform that all ordered/paid ESD mat sets has been shipped including an email confirmation and own tracking number with link to tracking website.

I hope that all will arrive safely and that You will enjoy Your new ESD tool as much as me in my home lab. Your comments will be appreciated. Hope that it will help to all of us with ESD protection during our homebrewing.

...and one more think

Yes, 1MOhm resistor to limiting the current is included in both blue coiled wires so additional grounding point with resistor is not needed.

My best regards,

73 - Petr, OK1RP

thank you
I have not seen a schematic, I do not know from what principle this arrangement works, it is not done for pfr3, but it may be based on the score BF or RF signal strength?

Ah, OK Steve, it is not silly, sometimes we forget the tone or we must get to meet exactly the same as the corresponding HF frequency,
if the filter is large is not easy.
small QRP TRX not setting the tone transceivers as the greatest
Many guys meet far enough frequency, it is a bit annoying for guys like me, not very good at Morse, H. I.
see you soon

Subject: Re: [pfr3_group] Re: CW Tuning Indicator

Jean Paul,

It is a simple tone decoder using an Exar XR2211 PLL I.C.. When the tone frequency is within 20 Hz of the PLL setting, an LED illuminates. I would think that an NE567 I.C. would work just as well.

Nobody has addressed my question about how it would work, considering it has to be within 20 Hz of the sidetone freq. and the PFR3 tunes in 50 Hz steps. How would this affect the way the tuning indicator is able to work? Let us say that the PFR3 is within 25 Hz of being zero beat with the incoming signal,so the LED shouldn't light as it needs to be within 20 Hz,if you tune up one step, you will now be 75 Hz away from zero beat and LED wont light. If you tune down one step, you will be 75 Hz below zero beat, and the LED shouldn't light, correct?

Steve is correct, in that the PFR-3 tunes in 50hz steps... solidly.. no in-between... and... the filter center.. is 20hz wide. The real question.. is how wide is the bandpass of the filter? IF it is a very steep sided filter ... then the PFR-3 may not work with it. However, being that the indicator is working at audio freq... and it is contained in a small pcb... I'd expect the filter notto have extremely sharp sides. The on/off maybe indicate a sharp response, and the bfo in the PFR-3 can be moved real easy to match the filter if it needs to be. Problem solved. right?Match the filter with the bfo.. one time.. put it all together.. RUN.. don't walk.. RUN to the field and make Qs.. Have a great day,

I think what probably confuses the ear for some operators using the PFR-3A is that it does not have a pure sinusoidal wave (single note) side-tone. Instead, it has a complex tone consisting of at least four partials. If you look at it on a frequency analyzer, you will see only the odd partials of a computer generated square waveform. On mine it is essentially comprised of the following frequencies, give or take a Hertz, with a 590 Hertz fundamental and several harmonic odd partials:

590*1=590 Hz
590*3=1770 Hz
590*5=2950 Hz
590*7=4130 Hz

The second of those, 1770 Hz, has the highest amplitude. That probably confuses my ear the most. I prefer a single note sine wave side tone (T1300 or an IC 703 for example) so that the side tone audio frequency is the same as the received audio frequency. (On the 703, that allows "zero-beating" the received station.) In any case, I agree with F6DDV, the PFR-3A (specs claim a receiver selectivity of 300 Hz) so it is impossible to be very far from the right frequency if you hear the other station in the middle of the pass band and likely you will be either spot-on the correct frequency or maybe within a 50Hz tuning step of it.

good evening Marq
Yes, very good performance, (3 x 3.6 V elements) not to + 12 V 12 V regulator if you forget to charge the load.
Or have a special charger Li-Ion battery that will work correctly
It is possible to temporarily 2 sets in parallel, because the voltage drops quickly to 11 volts, but it is sufficient that lasts many hours
with 5 W CW and it is very light, be careful , not to shock , no crash , no overload !

Yahoo group: pfr3_group
Date: 2012-09-07 09:56:12 UTC
From: sq1res
Topic: 3834 Message: 3834

Hi All,
My name is Jarek - SQ1RES. I'd like to say hello as I have just joined the group.I learn CW (few month) and I love to build homebrew radios so I've ordered PFR-3A kit few days ago. I wonder how long time I'll have to wait to get it. Anyway in the meantime, I'd like to create (modify a little) my own decals for PFR-3A. So I have one question: what is the max diameter of the LOAD and TUNE knob of antenna tuner ? I mean the bottom part of it.

Hello Jean Paul!

Bien Merci pour havez repondu! OK for your answer ! yes I know that you are using those batteries ...i've see your previous post.
I've 8 BatteriesAA Lithium inside...
What i need is a external baterie , i don't if is good idea to use a Lead Batterie like 7AH that i use for my HB1A. AS you know HB1A or even HB1H can work under 13 Volts with any protection.
Well my Lead Batterie with Solar panel I've 12,55 (12,60) Volts .
I prefer to use only 11V or 12Volts for PFR3 .
By the way i also purchase a Heestsink brass for BS170 Transistores.

73s and thanks

OK Marq
For PFR3 you can also use 4 Li-Ion 3.3V type that exists , is fine 12 V only ... no problem for the three bands HB1a I asked the seller to China, it accepts 4 LiPo cells! 15 16 V,
I was amazed at the response ...
Tested, no problem ...

From: orangelite
Topic: 3839 Message: 3839

Hi

I am leaving tonight for Washington's Olympic Peninsula coast. Tomorrow I will hike about 5 mi north of La Push and be set up with a campsite running my PFR3 to an inverted vee dipole and end fed wire. I should be set up by 2300Z. I will be doing the Washington Salmon Run, and will be QRV on mostly 20 around 14.060 as well as 30/40 meters. I will be there until Monday or Tues, depending on the WX. It would be fun to have some 2X QRP QSOs with other Yellow Units!

Well I suppose, since I kinda let the cat out of th bag as it were.

1. The most significant change (by popular demand) is using a rotory encoder for tuning.

2. Elimination of the Rx input tuning cap and input transformer. This is replaced by RFC's and trimmer caps and adds a third switch to the bands selection. This eliminates winding two toroids, one of which gave a lot of builders fits to get right.

3. The over all size will be slightly reduced, maybe by 10%

4. The controls with knobs will now come out the side of the box instead of the top. (Tuning, volume, BLT tuner) This helps reduce the size of the board and box and should make it somewhat easier to operate. The down side is there may only be room for six "AA" batteries internal (9V), but this typically gives 2.5 watts out.

Steve,

I am not sure I would call these "improvements." Let's see here, lower power and knobs will come out the sides where you can't see them when your operating on the ground. A tuning knob is an improvement if it is Optical. If it is mechanical, forget it. I am not sure your front end selectivity will be as good when using low Q molded chokes. I think I'd rather have the "old" PFR-3.

Jerry,
I agree with you 100%.
Everything that should be on the back is there and jacks for phone and keyer are on the front.
A few weeks ago (I THINK) I may have heard that bacon from Russia sending the letter M on the IC 7000.
So I hooked up both the prf3 and the HB1A rigs and the heard that M just above the noise floor.
If there were improvements that made the RX better I think it would only show on Lab grade gear.
I have the pfr3 on now with the buds in my ears as I type this and I have 31 feet of wire out the window.
Can't get no better then this.
Steve,Keep the pfr3 as is

Hello Bob and good morning
you talk about hate ... why?
I do not know if I understand correctly,
on the record that I kept after pfr3 built, it is written pfr3 A, but on the printed circuit board I can not remember what is written, I think it was B
but I think I remember that this is the pfr3B, I do not know the difference.
It seems that technical document was not updated, but I could be wrong

Hi Jean Paul,
You and Steve are the only ones who will respond to any questions I have.
Well I don't know what the difference between the pfr3 and the Pfr3-A is
but I think Steve did post something about the Pfr3B
OK I found his post here

Currently, there is no version "B" (though that might change in a couple
of months..)

Someone made a typo or is talking about something else.
Steve KD1JV

So there is no B but knowing Steve he just may be brewing something up.
I like my Pfr3 as it is and I get an honest 6+ watts out into a dummy load
and the RX seems like it's 300 Hz so it's super good for CW.
I always wanted that ATS 3 but I think when that came out and kits were
being sold I was taking care of my Mom because she was very sick.
10-to 12 hours a day and at the nursing home I did that each day for close
to 7 weeks before I caved in.
Right after that some ham sold me the HB1B 4 band rig.
The tuning on the Pfr3 some don't like but I'm always near or in the extra
part of the bands so I really don't have to scan much at all.

OK Bob, I understand now
I prefer my pfr3A as it is built, it must evolve in the series, this is normal.
Regarding the ATS, they are wonderful, but very hard to get, I look at the list that talks about ATS, this is very interesting.
I was hoping to find a TTY for the higher bands, and I liked the ATS-3 with modules that connect to each band.
It would be interesting for me, it is a platform with modules for ATS 10m 12m 15m 20m 17m maus it will probably be impossible.
Must obtain printed circuits and understand this and also have components.

Hello Bob
and hello to all
it is difficult, I have to write nonsense without realizing sometimes I have used simple words.
in French there are too many words to say a simple thing.
I've never known what was built before pfr3a
I included the following changes for version B, I prefer very few orders around the unit as possible and above, it is easier to protect I think, but I would look with pleasure the new TRX yellow .
I am looking for the series DCxxB boxes or kits down or have not been built, I think it is possible to mount on the higher bands with yellow toroids, I added a very useful RIT and VXO one to change the frequency of the quartz and quartz switch for 4, it can be fun to make modifications to his idea, it is quite simple to do this.
I am interested in this series, he takes one good W and it will easily into a pocket

WHAT IS THE DIFFERENCE BETWEEN THE PFR3 AND THE PFR3A

Very little. Mostly it was a change to the board layout to solve some assembly problems, but the "A" version did add an AGC circuit. That is the only electrical difference.

The new PFR-3B under development will differ from the earlier versions mostly in it's mechanical design, which is quite a bit different from the original. Some circuit changes in the wiring of the processor were required to accomidate the change to rotory tuning and an improved audio AGC circuit is used.

3870. Power output

Yahoo group: pfr3_group
Date: 2012-09-23 00:55:49 UTC
From: k6mgo@verizon.net
Topic: 3175 Message: 3870

Can anyone tell me if the windings on the output filter toroid are interactive with one another?

Reason I ask, I had noticed that my 20m power out had slipped to below 4.0 watts,while my 30 and 40 meter power out was still about 4.8 watts, with my 8 AA NiMH batteries.

So I went and did some squeezing of the turns of L8 and got 4.8 watts on 20m but then noticed that 30 and 40 meters only had 3.5 to 3.8 watts out, They dropped a full watt and no amount of squeezing or spreading could bring the power on those two bands back up. I haven't tried to mess with 20m as I was happy to get up to almost 5.0 watts.

So did my bringing 20m power up cause the 30 and 40 meters power out to go down?

Any help appreciated.

73, Bill, k6mgo

Topic: 3175 Message: 3871

Hi Bill, They are interactive, only on that one band... i.e. one pair of toroids interact with each other for that particular band... They do not affect between bands. However, the slightest movement of not tightly wound coils can change the tuning a lot. The 5 watts out.. however is very sensitive to a solid 50 ohm load, on any band. Good luck,

So I went and did some squeezing of the turns of L8 and got 4.8 watts on 20m but then noticed that 30 and 40 meters only had 3.5 to 3.8 watts out, They dropped a full watt and no amount of squeezing or spreading could bring the power on those two bands back up. I haven't tried to mess with 20m as I was happy to get up to almost 5.0 watts.

So did my bringing 20m power up cause the 30 and 40 meters power out to go down?

Any help appreciated.

From: sq1res
Topic: 3872 Message: 3872

Hi,
I'm at group 1 smoke test and everything is OK, just like in the manual (tune up and down, RIT and so on) except of DDS. I've connected my oscilloscope to R39/C41 point and I have a beautiful 1Vpp sine ... but the freq. is about 3,3MHz (0,3us) (?!)

Thanks for your reply Dale. Looks to me like you are telling me I need to rewind L8, L10 and L12 much tighter, to get and keep 5 watts (or as near to as possible)output?

Yahoo group: pfr3_group
Date: 2012-09-23 15:34:14 UTC
From: sq1res
Topic: 3872 Message: 3876

I checked resistance between points:
PIN2 (U7) and ground -> 3,2 kom
PIN3 (U7) and ground -> 3,2 kom
PIN28 (U7) and ground -> 3,2 kom

PIN13 (U6) and ground -> 2,2 kom
PIN14 (U6) and ground -> 2,2 kom
PIN15 (u6) and ground -> 2,2 kom

so R42, R44, R46 and R43, R45, R47 seems to be OK (properly connected and no shorts)
but the frequency at DDS is still incorrect - about 3,5MHz :(

I have another question to PFR-3A users:
1. How long it takes to display "40" really ?
Manual says: ".. Then the display should display '40' for another couple of seconds (indicating the band), then 030.0 (this is the frequency)",
but I have:
8888 - less then 1 second
40 - less than 1 second (!!!! - not couple of seconds)
030.0

Thanks again Dale, Just measured the P.O. with the 8 AA NiMH that haven't been charged in quite a bit of operating time, (I'm trying to see how long they last before needing charge). I am using a Elecraft DL1 as load, and DVM to read rectified D.C. Voltage, and am adding .3 Volt for diode drop then squaring and then dividing by 25 to get P.O.

You sure your measuring it correctly? Try to find the signal with another receiver or go into calibration mode and see if you get 10 MHz. Also make sure the reference oscillator is 50 MHz. You would be the first one to ever have this problem that I know of, which is suspicous.

It is working correctly. There turned out to be no need to show those start up displays for very long.

It's kind of hard to locate L7 without a layout of the bottom of the board, but using page 4 of manual I see L7 should be directly below S5 about 1/2" and key down, I get 8.58VDC on left side of pair of contacts.

--- In pfr3_group@yahoogroups.com, "Steven Weber" <steve.kd1jv@...> wrote:
> You sure your measuring it correctly?
Unfortunately, yes. I have used oscilloscope, frequency counter and finally my receiver. Results are the same. I spent half a day on testing and the problem is even more strange. I found that the frequency is not always the same, when turn off and turn on the board again. Usually it's 3,3MHz but also 130KHz, 890 kHz or even 200Hz. In other words - random. TUNE UP and TUNE DOWN doesn't change the frequency at all. I re-soldered all solder pads and re-checked them using magnifier. No changes.

> go into calibration mode and see if you get 10 MHz.
[CAL.r] on LED display but frequency in not 10MHz

> Also make sure the reference oscillator is 50 MHz.
It works perfectly - 50.000.030 Hz at 5 pin of U11 and Vcc is 3,5V

Topic: 3872 Message: 3884

I've found the bug and solved the problem !!
I started to check all the solder pads connections of AD9834. I found that there's NO CONNECTION BETWEEN THE LEG 13 (U6) AND ITS PAD. Previously, I checked the resistance between pin 13 and the ground, but I pressed the leg while doing that and then the leg was in contact with pad in this moment. That's why everthing was OK. This time, I did it very gently and there was no pressure on the legs and ... the cause of the problem was found ! I applied iron for a while and I have 11.945 MHz from DDS !!
Well, you have to check everything, including pre-installed components. By the way, leg number 13 (unlucky :))

3885. 1st Smoke Test Checks 4.0

Yahoo group: pfr3_group
Date: 2012-09-27 17:43:00 UTC
From: kc9spw
Topic: 3885 Message: 3885

Hello All,

I'm enjoying all of the posts and wanted to add one of my own.

My first smoke test checked 4.0!

Everything worked just as advertised except for the frequency check. I was not sure how to conduct the frequency check because I haven't built a frequency counter yet. I also wasn't sure how to attach an antenna lead to such a small connection on the chip.

Hmmmm, American ingenuity required. Let me think, let me think...

So, I tuned my Radio Shack Realistic DX-440 to the appropriate frequency and held the board next to it. A nice strong static sound coming from the 440 told me something must be working correctly. So I dialed up and down the band a few kHz on the 440 and the signal weakened. Back on frequency = a strong static sound. I turned the PFR3 off and the static ceased. I figured the board must be making all that static.

Is that a scientific approach or what? Ha Ha!

Having fun!

From: beargyrils@aol.com
Topic: 3892 Message: 3892

When I first got this rig that was already built,
It did not power up on the internal batteries.
Someone told me that there was some sort of issue but I pulled the batteries out and cleaned things up and all was OK.
The other night I put in new good energizer batteries and I wanted to try my experimental wire antenna.
The rig was on and when I plugged in the key I wanted to set the CW speed up.
I heard a loud snap like a spark.
The rig went dead but all is OK with the external battery but with the external battery when I press in the button the battery light is very dim so that tells me I have a problem.
I checked the switch and that was good.
I didn't want to do any more because I remember 2 members said they had the same problem.
Appreciate any help,suggestions,etc.
Thanks
BOB

Hi,

My PFR-3A was made and works realy good. Some small modifications:
- low power indicator (it consumes 0,5mA at normal, "high power" state)
- 100om resistor @ headphones output (to decrease LM386 white noise hiss, thanks to John VK7JB -)
- dials for Load and Tune knobs (to easy memorize its position)
- color change (some of you may say, it's a kind of profanity to change the color of the "Yellow Fellow", hi hi)

You can see it in my "Assembly steps by SQ1RES" Photos folder

I looked at the photos and say--Congratulations on a beautiful job.

What type did you use? I really don't care for the yellow.

Thank you Marq and Jerry for your opinion.

The color is silver metallic - spray paint for my car. Now, I have the car and rig in the same color :)
The bottom part is RAL 5003 - Sapphire Blue. It was also in spray.

I like yellow PFR-3A too, but I hate (or afraid) wasps, bees and hornets. To stay in yellow themes, I decided to use volume knob with yellow pointer.

I also own one of those 31 foot poles, as for my operations I move the apex down a but due to the very thin top section, any excessive wire wieght seems to pull it over further that I would like. So I leave the very top section bare and just pace the wire a wee bit lower for a dipole, on the EFHW its not a real issue so up to the top it goes.
Just my take,
Danny

Well, if it still works okay with external power, that must mean something went bad with the battery holder. Take a close look at them and you will likely find some mechanical defect.

Fellow PFR'ers,

I also had problems with the battery holders that came with my PFR-3A. I junked those and replaced them with 4 cell holders from Radio Shack which position 4 cells side by side in each holder rather than end to end. Absolutely no problems since using internal or external power.

This past weekend our local Adventure Radio Group set up on a small island called Island Park in the St. Joseph River where the river passes through Elkhart, Indiana. Using my PFR-3A and my Buddipole set up as a twenty meter dipole I logged 22 contacts in less than 3 hours. I was using the internal batteries which were a bit run down and the measured power out was barely 3 watts. Our island is now official for island contacts IN010R.

I've been able to make an incredible number of contacts with my PFR-3A including over 25 DX stations with much of my operating portable. I even sold my FT-817 because I prefer the little yellow box.

Dale and/or Steve,

One little bug which I and several of the other owners have had: the rig temporarily jumps frequency back to default when tuning with the buttons. It always comes right back but it would be nice if it didn't do this. Is there a fix to cure this?

OK Lee, it is very simple. I added the scheme to my photos folder. Of course, LED will light when the battery voltage drops to the limit e.g. 9V (setting by P1) and it is clear, I think, but ... this LED has also the second function.
It lights for a moment when you turn the rig on. If the battery is 12V, LED lights up briefly. If the battery is e.g. 10V, LED lights a little longer. This is because C1 capacitor needs time to be charging. You can try other values of C1. If you don't need this function, do not install C1.

3911. PFR-3A For Sale

Yahoo group: pfr3_group
Date: 2012-10-06 01:50:37 UTC
From: kf6u_gary
Topic: 3911 Message: 3911

After much personal debating, I have decided to sell my PFR-3A. It is a fun little rig with no issues. Some minor wear marks from use, but no dings or scratches.

It has the optional paddles and upgraded binding posts on the rear panel. I added a power jack on the side for charging internal batteries, as well as a test jack so you can measure the battery voltage with a multimeter without opening up the case. A 12 VDC wall wart for charging batteries is included. Batteries are NOT included.

This rig was built by a professional electronic technician with over 40 years experience (that would be me).

I will email photos to anyone interested.

Price: $225, shipping included (U.S. only). Payment by U.S. Postal money order.

Please email me direct: garyjane1@...

72, Gary KF6U

Bob,

I believe that the problem is either the battery holder or the power switch.

You have replaced the batteries - so they are clearly not the problem.

You say that the battery holder is not the issue - I had dreadful trouble with mine, and ended up soldering the crimped contact between the + side on the output and the solder lug together - Have you confirmed that when measured between ground (The metal case of the DC-in connector) and the + output of the battery holder where the wire enters the circuit board at the point labeled BAT), you can see +12v?

If you see +12V, then the only other possibility is the power switch.

Doug

It seems his rig has the optional Battery Status Monitor installed and that is the "dim" light he was refering too. Whole different problem, most likely with the way the monitor was wired up or isn't adjusted properly.
Steve.
I believe that the problem is either the battery holder or the power switch.

You have replaced the batteries - so they are clearly not the problem.

Try adding a 0.1 ufd by-pass cap to the resistor divider for the control switches. A convenient place to add it is across the "Menu" switch. That seemed to cure one rig which had that problem and was acting up more then usual.

Steve

☐
One little bug which I and several of the other owners have had: the rig temporarily jumps frequency back to default when tuning with the buttons. It always comes right back but it would be nice if it didn't do this. Is there a fix to cure this?

Try adding a 0.1 ufd by-pass cap to the resistor divider for the control switches. A convenient place to add it is across the "Menu" switch. That seemed to cure one rig which had that problem and was acting up more then usual.

Steve

I also noticed this anomaly in my PFR-3A and implemented Steve's suggestion to add the 0.1 uF capacitor as noted. Problem solved! Much appreciated Steve.

From: KI6DS
Topic: 3925 Message: 3925

I have finally found an affordable case supplier who will provide painted silk screened cases for the PFR3A. I started shipping kits with them this week. So all orders for PFR3A's from now on will come with a silkscreened case. No more decals. I know that I will get requests for cases, and I will offer cases shipped for $40 via priority mail to US Addresses and $48 via global priority mail. If you would like a a new silk screened case for your PFR3A, please send me the above amounts via direct paypal to ki6ds@qrpkits.com along with a note stating that you want a PFR3A case. Or if you don't use paypal, you can send me a check or money order in US funds only. Please make checks and money orders out to Doug Hendricks. Thanks, Doug

At best, we could put tick marks for the knob pointer, but the exact locations of where something tunes has a lot of variables, mostly how you wind the core. Although it does seem that once you find the positions at which a load matches, other loads will match at close to those same points.

On My PFR I just marked some lines and numbered them and put notes on my
log for tuning positions for my doublet.
Very handy when its cold on a sota summit and you want to tune up fast.
I will still order a case though.
Thanks

From: k6mgo@verizon.net
Topic: 3937 Message: 3937

Hi guys,

Here is a little bit of info that might come in handy for you. I was running some experiments with the end-fed 6-40 meter vertical that Stan, WB2LQF posted about a while back. I built mine and hang it from a Jackite 31' kite pole. Using it out on my patio, which is not very open and surrounded by two 2 story homes, I was trying to improve it's operation on 40m which is it's weakest band.
I setup a test with my buddy Dale, K6PJV up in Sacramento, CA, about 361 miles away from me. With just the antenna, just the way it's designed by the Hawaiian Radio Club, he heard me at S6 on his K3. I then added a homemade ground system and went to S8, pretty darn good improvement.
This is the ground system. I went to Home Depot, and bought a roll of 3" aluminum tape. (real aluminum, not cloth tape silver in color) in the heater section. I cut 4 five foot strips of the tape, and left the paper backing on it. I then drilled a quarter inch hole in one end of each of the strips, and assembled it with a 1/4" bolt, heavy braid strap or lead and put very large washers top and bottom to spread the strain. I fan the assembly out in the shape of a cross, with the center right under the antenna feed point, connect the ground strap to the braid of the coax at the feed point and that's it. It hardly takes up much room, is light, and cheap. I think the aluminum tape cost about $5-6 dollars for a big roll that has way more than needed for one ground system. It also improves the performance of the antenna on the higher bands too, and would be just as effective on the Buddipole or Super Antenna MP-1, type antennas and any other vertical needing a ground system.

Thanks Bill,

I think I'll try that with my Buddipole when set up as a vertical. Presently I use an elevated counterpoise stretched out to the proper length for each of the three bands 20, 30 and 40 as required. The comparison should be interesting.

Here is a correction.
My friend now says that my signal didn't go up 2 S units, but the QSB was making it go up and down about 2 S units. He said the signal with the ground was about 1/2 an S unit better with the ground system, which verifies what Reverse Beacon Net showed and that is with the ground system, my signal was consistently 4 dB stronger than without it. Still, 4 dB is a significant improvement for so little money and effort.

That would be a very interesting test Keith, to see if this little ground system works as well or better than the single radial. I also used a single radial with my MP-1 vertical, and will try the foil strips with it to see how well it does, because my little patio hardly has room for a 40m radial.

3942. New Case WITH

Yahoo group: pfr3_group
Date: 2012-11-02 20:02:29 UTC
From: Dale Putnam
Topic: 3942 Message: 3942

I am in the process... (define that as time consuming) of finishing a pair of PFR- 3 cases... with the decals...It strikes me as very exciting to see Doug bring out the silk-screen labeled cases... that one thing will shave much time off getting the case ready. Another way to look at it is, the board is completed.. yet the case is still waiting.. I don't have a paint room... and must paint according to the whims of the weather. Dust, moisture, wind, all prevail. I'll spend upwards of 3 or 4 weeks getting just one case ready. That one thing would almost make it worthbuying the new cases to use on these last two radios.... I know.. it only takes about 5 minutes to put a coat on... but this time of year... it takes a whole lot longer than five minutes to get the right wind, temp. and moisture conditions.It would be worth it if I had one of my own to replace... a quick trip to http://www.qrpkits.com/ place an order.. and done. hmmmm..... Have a great day,

3943. Touch key paddles

Yahoo group: pfr3_group
Date: 2012-11-03 10:20:36 UTC
From: sq1res
Topic: 3943 Message: 3943

I've made the touch key paddles for my PFR-3A. Works great so I'm very satisfied.
Does not take place for battery container (small, thin SMD PCB) and consumes only 1mA current.
I have described the technical details in FILES section.

You can see it:

3949. FOX: HUNT OPENS

Yahoo group: pfr3_group
Date: 2012-11-06 14:47:06 UTC
From: Dale Putnam
Topic: 3949 Message: 3949

WHAAAHOOOOO!! FINALLY THE DAY IS HERE. The Game Warden says, the wait is over and we are good to go... on 40M tonight! There are two foxii that will be sneaking out of their dens.. sniffing around.. and sly and shy as they are... they will be calling"CQ FOX"... somewhere between 7.030 and 7.050 ... at 0200z (that is 7pm MT) and for the next90 miutes, you will be involved in the most fun to be had in 90 minutes.. on your radio. The exchange is pretty standard, and easy to do... the props are great.. the Foxii are super, fun is memorable. Come see for yourself!! Watch for the FOXii announcements on the qfox reflector too! May the props be Ever in YOUR Favor!

3956. Fox: Hunt Tonight - WC7S

Yahoo group: pfr3_group
Date: 2012-11-13 14:48:07 UTC
From: Dale Putnam
Topic: 3956 Message: 3956

I will be one of the FOXii tonight, with the exemplary K4BAI, in the 40 acre forest.Somewhere between the two trailheads marked 7.050 and 7.030, we will be out of ourdens by 0200z and will return to the safety of our den again by 0330z. Ok.. that's the layout, here's the straight info,The exchange: RST, SPC, Name, Power (not more than 5 watts!) Listen closely to what is sent by the Foxii, the call will be:"FOX WC7S UP... (or) DOWN" For those close, try to grab a pelt early, if not successful, don't give up, I have 5 antennas that all work well, and I will be changing antennas often to allow all hounds a chance to grab a pelt.Stay late too, the props often slip in a late hunt opening starting about the time the band goes long, to select areas. The equipment here will be a K2 at 5 watts, (my tribander is offline currently). The antennas:Three 360 foot long center fed at 50 ft, fed with balanced line. A 100 foot dblt at 30 ft, fed with open balanced line,and a vertical on steel roof, 15 ft above ground. I'll be sly, shy, and listening intently for you. See you tonight!!

--... ...--
Dale - WC7S in Wy

I will be the other Fox in tonight's QRP fox hunt on 40M (with Dale,

WC7S, in WY). Look for the two foxes between 0200 and 0330Z Tuesday

night (9 to 10:30 PM EST) between 7030 and 7050 kHz. Run no more than 5

watts. I will be using an FT1000MP at 5W output as measured by the WM-2

QRP Watt Meter and a coax fed 40 meter dipole up about 40 feet. I will

start out listening UP and will indicate that by CQ FOX DE K4BAI UP.

When the pile up dies down, I will stop saying "UP" and will be

listening on my own frequency. The exchange is RST, SPC, Name, Power.

So, I will be sending real RST, GA, JOHN, 5W. Hope the skip won't be

too long and that I can work most of the country. It will be difficult,

but not necessarily impossible, for those close in. Give it a try and I

will keep it up for the entire 90 minute period. 73/72, John, K4BAI.

3957. FOX FOXHUNT Thurs pm

Yahoo group: pfr3_group
Date: 2012-11-15 01:18:48 UTC
From: Dale Putnam
Topic: 3957 Message: 3957

There's a FOXHUNT Thursday evening (7pm MT) or Friday morning 0200z (whichever way you set your clock from DST.. or not).Bring your best horse and dog.. and of course ... your best fist... oh.. and don't worry about the BIG ENGINE.. you will only need 5 watt brake horsepower, measured at the axle tx. Gather up at the edge of the 80 acre wood and mount up, ready to ride at 0200z or 7pm MT and we will go hunting... a hunting we will go...somewhere between the two markers marked 3.550 and 3.570. Dave N1IX and I, Dale, WC7S will be your shy, sly, slick, FOXii. Here's the deal, you listen real good, y'hr? and we will tell you where to plunk down to fire.... sometimes, historically, the FOXii will look UPhill.. and other times.. Dwnhill. so be listenin' and of course, since it isn't real comfy to pileup on top if each other.. you can't reach yoursippin liquid.... nor find you glasses to look for us with... besides that.. elbows and knees don't make soft sittin.... so SPREAD OUT ... you just might find it a whole lot more productive. After you make your shot, one time.. maybe twice... hush up and listen some more.. we will be moving around.. and it would be advisable to be prepared to fire again, from the right place... another reason to not get all stuck up together... no movin room. When you hear your shot hithome... answer with the signal report, (RST) , your state, province, country, (SPC), your name, and Pwr, (no more than 5 w or you will be de-listed, and no one wants that) So.. Let the Games Begin, and May the Props be ever in OUR Favor

Yahoo group: pfr3_group
Date: 2012-11-25 05:26:44 UTC
From: zl1klp
Topic: 3958 Message: 3958

Hi all,

I'm living in the countryside where farm animals are kept in their designated paddocks using electric fences - driven by a dirty 11kV pulse every ~1 second. The fence lines are long causing massive
'snap' through my headphones.

Wondering if anyone's got powerful yet simple NB circuit to suggest? I have no issues with my 746pro with NB on - so it is possible to get rid of the issue.

I keep my own horses in with an electric fence, that at times... can be viscious on my ears. I have found that the elecraft analog filter does a remarkable job in dealing with that. The analog filter is almost the same size as the PFR3 tho. The NESCAF filter does a good job of narrowing things down to where the snap doesn't rip my ears off too, and it is a lot smaller.

Topic: 3964 Message: 3964

Two fine FOXii are to be out of their dens in 25 hours, to make their pelts available to all those Happy Hunting Hounds, in the 40 acre woods.Come be a part of the most fun in 90 minutes that you can find.... on the radio. You'll find both ot the FOXii, AB9CA/4 and K9CW somewhere between the trees marked 7030 and 7050, running about 20mph...(wpm) and even tho they are shy and sly... they'll be doing their best to insure they don't carry too many pelts back into the den at 8:30pm MT (0330z). Ya'll come have fun, Y'ear? Check out the rules on http://www.qrpfoxhunt.org

Hi Lynn, My Tribander (TB) is a Doug Hendricks (QRPkits.com) kit that can be built (hole thru) for any of three bands, of 80-40-30-20-17 or 15. It is a nice brushed aluminum that paints well, with a bail to tilt up some, nice addition to the desk.And it is small enough to fit in a backback. Very efficient, too. I've run after the foxii and been successful connected to a 9v transistor battery. It does not have a tuner built in like the PFR3 doesn, but the BLT tuner in its brushed aluminum caselooks very nice sitting along side if it is needed. It's familial history is one of success, from the same designer as the PFR3 and the ATS series radios. It is a nifty addition to the shack, or den. I have my bride's blessing to bring it into the family room, and leave it settin on my desk there, right where everyone coming in to visit will see it. So it has eye appeal acceptability too. (She wouldn't agree to any of my other radios, like the Icom 761, Elecraft K2, or SB104a.... So, I have it on my desk, within easy and quick reach for those dx posts that pop up, for the next "wanted" country.. and I want to get there before the crowd... I can be on the air within a matter of a minute or two. It has a volume control, earphones are best, although there is enough room to add a speaker if you just have to, built in keyer, rotary knob to tune, and RIT. I've built, aligned and optimized a few for folks, and they have all come up easily, with a sensitive receiver and a narrow filter, that makes it easy to exceed the published specs with. I'd be happy to answer any questions? Have a great day, --... ...--

The Yahoo group "DualBander" covers both the Weber radios, the DualBander and TriBander kits sold by Hendricks Kits. The group covers both radios. The DualBander is discontinued so most of the posts are currently about the Tri-Bander.

Hi Al, If you wish to build one, they are certainly available, and the help here, on this list is amazing, and very plentiful. OR someone can build it for you, without charging you anything. Just the shipping to get it here and back,and that runs right at 15 dollars. The case now has silk screened labels, and I clear coat over that a couple coats, for protection. The basic hole through design lets you do it all. The smd parts have already been put on the board. OR.. if you want to try building it, and run into trouble, I'll make it all well, and spec it, with specs that you can trust, from NIST traceable equipment. Again, no charge, but the shipping. The price of used ones are very much like a new one, unless there is something the seller knows that you don't.A Better New Year to you and yours,

Have a great day,

Hi Al, well many hams your age aren't even thinking of CW. I guess you used the T-10 and that was heavy. I was HALO with. The Rangers and in NAM opening at terminal with a square was about 6 G's with the extra gear Dale built my first pfr3 and it was flawless and each band was close to 6 watts. I'm on another list where hams in the UK operate mobile and always try QRP. Last week one posted his contacts and he got into VE3 land and a W4 ham. I made good contacts with mine using and end fed wire and a 3 foot diameter mag loop. GL with the rig. Bob AF2Q

Subject: Re: [pfr3_group] Anyone have a PFR-3 for sale?

Hi Al,I have the sale pending on the built unit and I did agree to wait until after the new year. Dale just made a post and he builds free,no fee and just order the kit and have it sent to him. You just pay the shipping fees Bob AF2Q

Subject: Re: [pfr3_group] Anyone have a PFR-3 for sale?

Thanks Bob! I am an OT first licensed in 1949 as DL4LQ and my hands no longer work good enough for kits but OK for CW!!

Can you quote me a total figure on the completed kit? Tnx agn! 73 Al W6JHO

Subject: Re: [pfr3_group] Anyone have a PFR-3 for sale?

I will have one up for sale in about one week.
Also starting a build on a kit on my own since response for help on the list is near zero.
It is pretty much straight forward so why not build one?

Hi all.
Ive had a couple of these PFR3's and then sold them to other freinds, however the current one i am modifying quite extensively as i have found a number of things that i would like it to do which it doesnt .
1st the filtering is to narrow to receive anything other than cw. the front end tuning is nearly there but isnt , the bfo is fixed which doesnt help, its not that sensitive using simple portable aeriels.
So to start with the the BFO xtal trimmer is removed and aMV209 varicap is fitted in its place fed by a +10 volts stablalized by a zener and fed via a 100k pot. this allows the xtal to be swung about 1.5 kcs.
2 the three capacitors C8,9,10 arnt fitted or removed and varicap diodes are fitted in series with 200 pf caps each one fed via a 100k resistor with a decoupling cap to ground and likewise fed of the +10 stab line via a 100 k pot .
This allows the xtal bandpass filter to be opened out to about 8 khz in my case which allows the receptioof SSB
3 the capacitor C22 in the feedback loop on the audio preamp is only fitted by one leg, the other leg and connection are taken out to a 47 k pot and this allows the audio to be narrowed to were it was designed to be or opened out for the receiption of SSB.
4 the 4.7 pf between the rf tuning coils is removed/not fitted and in my case a jfet is fitted with the input coil fed to its gate and the output tapped off its drain via the 4.7pf capacitor with a 10uh rf choke feeding the drain via a 100 k pot of the 10 v stab line this allows some form of Rf gain control .
I have found that the front end coil does tune t40/30/20 however the second coil will not reach the end either if you tweek it to 20m then it wont reach 40 and likewise if you tweek it at 40 it wont reach 20
So it was tweeked at 20 and two tunes removed off the coil and with a 47 pf added across the cap it seems to track about right to 40
The four pots are fitted to a small extension plate on the side of the PFR3 and painted yello.
so there you have it so far .
The next mod will be to mod the TX for DSB and forward bias the output trany's and see if the output filters will get rid of the harmonics. we will see it all good fun anyway
Happy new year all.
when its all done the mods will be put on the files section
cheers
Roy

Hi Roy,

PFR 3A receiver assembled per manual copies USB on 7MHz and LSB on 14MHz. Are you saying your BFO mod makes the rig capable of adjusting to the opposite (customary) sideband?

Thanks.

3990. Re: Anyone have a PFR-3 for sale?

Yahoo group: pfr3_group
Date: 2012-12-27 14:10:28 UTC
From: Roy
Topic: 3981 Message: 3990

Hi Lynn.
the standard PFR3 will copy ssb poorly however its on the wrong side band .
if you do the bfo mod you can swing the bfo xtal about 1.5 khz. this in its own right isnt enough to bring the correct ssb sideband into the audio range.
Further the severe selectivity of the PFR3 filtering doesnt allow the bandwitch of an SSB signal to pass through and whilst the bfo mod will possibly move the bfo to the right sideband the bandpass filtering wont allow the whole ssb signal through and so the audio is muffled and distorted .
So if you remove C8.9.10 then it opens the xtal filter wide which will allow the whole ssb signal through and you can then swing the bfo over to the correct sideband and by moving the incoming signal by shifting the main tuning to move the incoming ssb signal to within the now widened I.F. bandwith it is quite easy to resolve the ssb on 40 and 20.
By removing C8.9.10 the bandwitdh is so wide that everything comes through and i have added a variable vari cap diode to each xtal to allow the bandwidth to be swung from wide to narrow just like the elecraft KX1.
Hope that helps
cheers
Roy

3991. Re: [pfr3_group] Re: [removing C8.9.10] to allow copy of correct side band for SSB reception

Yahoo group: pfr3_group
Date: 2012-12-27 14:32:38 UTC
From: lahagar1@aol.com
Topic: 3981 Message: 3991

Roy,

Thanks for you prompt reply.

From your description it would appear that after your modification the radio will hear both USB and LSB but not have a selectable (or unique) side band. Your narrow filter adjustment would help, but seems that hearing both sidebands would make it perform somewhat like a DC receiver, resulting in unwanted sideband QRM during CW reception. If so, then as a CW transceiver, I probably would not opt to make this modification.

Did I understand correctly?

73,
Lynn

3992. Re: [removing C8.9.10] to allow copy of correct side band for SSB reception

Yahoo group: pfr3_group
Date: 2012-12-27 15:42:23 UTC
From: Roy
Topic: 3981 Message: 3992

Hi Lynn.
The answer to your analysis is yes if the bandwidth is left wide open then both sidebands will be heard, however once the correct sideband has been tuned in the other sideband can be cut out by reducing the bandwidth using the variable bandwidth control to such that only the correct ssb sideband is audioable. As you say if you want a cw transceiver then why do the mod in the first place .
however if like me, fellow amateurs like to squeeze a gallon out of a pint pot then this was my aim .
Now with the controls that you have on the modified pfr3 if they are all returned to their fully non operated position you have the same spec as the original pfr3 with the original PFR3 performance.
the choice is yours.
The mods are fully reversalbe should you wish to revert to the original spec.
have fun
Cheers
Roy

From: lahagar1@aol.com
Topic: 3981 Message: 3993

Roy,

That does sound like a useful modification to allow SSB reception and one that will not degrade the CW perfomance.

Thank you for taking the time to explain -- I saved your email instructions in my 'to-do' file.

73 for 2013,

Lynn . .

Subject: [pfr3_group] Re: [removing C8.9.10] to allow copy of correct side band for SSB reception

Hi Lynn.
The answer to your analysis is yes if the bandwidth is left wide open then both sidebands will be heard, however once the correct sideband has been tuned in the other sideband can be cut out by reducing the bandwidth using the variable bandwidth control to such that only the correct ssb sideband is audioable. As you say if you want a cw transceiver then why do the mod in the first place .
however if like me, fellow amateurs like to squeeze a gallon out of a pint pot then this was my aim .
Now with the controls that you have on the modified pfr3 if they are all returned to their fully non operated position you have the same spec as the original pfr3 with the original PFR3 performance.
the choice is yours.
The mods are fully reversalbe should you wish to revert to the original spec.
have fun
Cheers
Roy

> From your description it would appear that after your modification the radio will hear both USB and LSB but not have a selectable (or unique) side band. Your narrow filter adjustment would help, but seems that hearing both sidebands would make it perform somewhat like a DC receiver, resulting in unwanted sideband QRM during CW reception. If so, then as a CW transceiver, I probably would not opt to make this modification.

> Hi Lynn.
> the standard PFR3 will copy ssb poorly however its on the wrong side band .
> if you do the bfo mod you can swing the bfo xtal about 1.5 khz. this in its own right isnt enough to bring the correct ssb sideband into the audio range.
> Further the severe selectivity of the PFR3 filtering doesnt allow the bandwitch of an SSB signal to pass through and whilst the bfo mod will possibly move the bfo to the right sideband the bandpass filtering wont allow the whole ssb signal through and so the audio is muffled and distorted .
> So if you remove C8.9.10 then it opens the xtal filter wide which will allow the whole ssb signal through and you can then swing the bfo over to the correct sideband and by moving the incoming signal by shifting the main tuning to move the incoming ssb signal to within the now widened I.F. bandwith it is quite easy to resolve the ssb on 40 and 20.
> By removing C8.9.10 the bandwitdh is so wide that everything comes through and i have added a variable vari cap diode to each xtal to allow the bandwidth to be swung from wide to narrow just like the elecraft KX1.

3994. New build, new ham, little experience with radio.

I'm brand new to this forum and thank you in advance for your help. I'm new to ham radio and I have decided to jump directly into CW. I have completed a Rockmite 40 (and it works) so I have some soldering skills. I found myself wanting more than the Rockmite would give me so I decided to order the PFR3. I haven't received the kit yet but I started reading the manual and I have some concerns. I have attempted to answer my questions by using the search function on this group. I can see that this question has been asked before but I unable to decipher the vernacular used to answer the question so I'm asking it again. My concern/question is regarding the calibrations recommended. I have neither an oscilloscope nor a frequency counter. Even if I had them, I wouldn't know how to use them. How necessary is this step, can the radio be used if it is omitted and is there a "close enough" way around it? Please type slowly and use little words if possible. I really want to understand your language but I'm not there yet. Thanks again.

You have several options, one of which would be to get in touch with a local Ham who has the equipment and experience to aid you in the calibration. There may even be someone in the group local enough to help you.
If that's not possible, you can forgo the DDS calibration, reference frequency calibration, and proceed to the BFO adjustment which can be done by ear - this is all covered in the manual.
Skipping those ateps is not ideal - but will still yield a very usable radio.

Hey Hi Brett, and a Welcome!!The calibration has a significant impact on the sensitivity. A scope isn't really needed.. if you have a vom.. that would work too.But you can get by without doing the scope thing, just use your ears.. same as hearing a heartbeat of a foal.. before it's born.. listen hard for thedifferences. OR.. if you want to build it.. leave the knobs off, stick it into a priority mail box, (small) and send it over here.. I'll calibrate it for you.. no charge. And, I'll send back an emailed spec sheet showing you what it is doing for sensitivity, and pwr. Either way, we can work it out.. kinda like birthing a big calf.. from a too young heifer... it is a fair amount ofwork.. and attention to details.. but helping hands are plentiful.

Have a great day,

Thanks Dale, and thanks for speaking my language. I don't know what a VOM is but I do know what a foal's heartbeat sounds like. I would like to take you up on your offer once I complete the kit. I will let you know when that happens. Nice to hear from our neighbors to the east.

Yep.. sometimes the language just plain gets in the way.. kinda like talkin to a horse... most folks don't understand. a vom... (volt-ohm-meter) can be pretty inexpensive, but the better ones (more accurate, and last longer from the occasional drops and ooops) might cost 25 or more. The really expensive ones.. have lots of bells and whistles.. but don't really do much more than the $40 ones... but they carry a big name. (I can't sell name, unless it is registered, with a national registry)... AQHA.. or.. some such. I dropped my AQHA membership, when I finally figured out that I couldn't make any money raising Hancock-Whimstar-Major Thunder colts.... Anyway.. we can do this.. if you have any issues building.. just ask, k? I have one right now on the bench doing the final check out. Oh.. and when you get to the tuner toroid.. that is kinda fun .. too. It's kinda like wrappin a sprained leg. But using three lengths of wrap, not just one. The other toroids are pretty straight wraps. Just don't overlap the wrap. The soldering is kinda like branding... enough heat.. long enough to flow, is good.... too long cooks the board, too deep. Do you do large animals or small.. oh great.. now I ask.. .. like I'm just a little late with this one.

Have a great day,

Brett,

Welcome aboard. I have been a fanatic PFR-3A user for almost 2 years now. Have worked at least 25 countries plus, of course, many of the states. I aligned mine with my TenTec receiver to give me a 10 mhz signal and a VOM (volt ohm meter). You can get a decent VOM for under twenty bucks at Radio Shack or Harbor Freight or at most hamfests. Very easy to align and not really that critical.

As a side note I like my PFR-3A so well that I sold my Yaesu FT-811 and have not missed the Yaesu a bit!

Keith
WA9S

PS. And you could always have Dale align it and it would be perfect.

I have my PFR 3, with internal battery indicator, for sale at $180 plus postage, if anyone is looking for one. I have used this rig successfully on numerous occasions, and even secured first place in the CW section of the national field day contest, the John Moyle Field Day of 2012. Last week I had a qso with Argentina and New Zealand, using a simple dipole. Rig works fb. A pic of the rig is on my qrz.com page.

We have a volunteer.. I got to checking.. and sure enough.. Rick NK9G has a partner.. so there will be two FOXii running
and slinking around in the 80 acre woods.. somewhere between the two trees marked 3550 and 3570...
hiding and slip sliding around... handing out all the pelts possible..

so we are on ...

Sorry for the late announcement.. time gets past so fast... it's just a good thing I checked...
Good luck to each of you, and may the Props be Ever in OUR Favor!!!

oh.. the other volunteer?? I checked... it's me.

Good Hunting! Find me if you can.. I've got a new temp antenna up.. this time in 50 mph wind... but the temp is 53F..
So.. maybe it will be a 50/50 antenna?

Have a great day,

Fox Delta in India (www.foxdelta.com) makes some nice frequency counter kits. I recently built their FC3, very good value. They claim it goes up to 500MHz, but I did a couple of tests that indicate that even above 1GHz the accuracy is still quite good.

The kit costs $59, which includes the metal housing. It goes together in a couple of hours, and once completed you download the software that Tony I2TZK has written to calibrate and finish the set-up. Mine didn't need any calibration though...frequency was spot on.

Subject: RE: [pfr3_group] Tribander wins again

Hi Lynn,
My Tribander (TB) is a Doug Hendricks (QRPkits.com) kit that can be built (hole thru) for any of three bands,
of 80-40-30-20-17 or 15. It is a nice brushed aluminum that paints well, with a bail to tilt up some, nice addition to the desk.
And it is small enough to fit in a backback. Very efficient, too. I've run after the foxii and been successful connected to a
9v transistor battery. It does not have a tuner built in like the PFR3 doesn, but the BLT tuner in its brushed aluminum case
looks very nice sitting along side if it is needed.
It's familial history is one of success, from the same designer as the PFR3 and the ATS series radios.
It is a nifty addition to the shack, or den. I have my bride's blessing to bring it into the family room, and leave it settin on
my desk there, right where everyone coming in to visit will see it. So it has eye appeal acceptability too. (She wouldn't agree
to any of my othe r radios, like the Icom 761, Elecraft K2, or SB104a....
So, I have it on my desk, within easy and quick reach for those dx posts that pop up, for the next "wanted" country.. and
I want to get there before the crowd... I can be on the air within a matter of a minute or two.
It has a volume control, earphones are best, although there is enough room to add a speaker if you just have to, built in keyer,
rotary knob to tune, and RIT.
I've built, aligned and optimized a few for folks, and they have all come up easily, with a sensitive receiver and a narrow filter,
that makes it easy to exceed the published specs with.

I'd be happy to answer any questions?

Have a great day,

4016. PFR-3 For Sale

Yahoo group: pfr3_group
Date: 2013-02-12 18:40:17 UTC
From: Stan ae0sl
Topic: 938 Message: 4016

I have a well-loved PFR-3 that is available for sale. It works perfectly and has been in a non-smoking home and a few expeditions to local parks. I am a full-time QRP CW operator, but the PFT-3 has just been sitting on the shelf since I bought a KX3 in December.

There are very minor imperfections in a couple of the decals, but I am including the second sheet of decals. I will part with this fine radio for $200 plus actual shipping charges.

Subject: [pfr3_group] F.S. Heathkit IG-102 Sig Gen

I've a nice G-102 sig gen for sale, it works, and is what you'd expect. No.. not museum quality.. but then these are working units. It is priced at $75 shipped to your door. (US only) Outside US you get to pay the shipping.Photos available. I have a digi manual, and they are available online. email direct please, before it goes to ebay. It does 100 kc to 110mhz. (It was made before hz came into fashion) and it can go to 220mc by using the harmonics.And it has an internal 400cycle osc for internal mod. (am) Please contact direct, soon.

4029. IARU Region 2 Seeks Input on HF Band Plan

Yahoo group: pfr3_group
Date: 2013-02-19 13:27:40 UTC
From: KU4GW Cliff
Topic: 4029 Message: 4029

The ARRL is seeking input to proposed band plan changes in the upcoming IARU convention in Mexico. Everyone needs to read the proposed changes, and voice any support or opposition as you see fit. The proposals can be seen here: http://www.arrl.org/news/iaru-region-2-seeks-input-on\ -hf-band-plan (http://www.arrl.org/news/iaru-region-2-seeks-input-on-hf-band-plan\) ITU Region 2 hams, especially CW and digital mode operators better be for submitting any comments quickly to oppose putting our 40 meter bandplan in step with either ITU region 1 or 3! There is a March 1st deadline for submitting comments! I have already submitted mine in opposition. Submit them ASAP to bandplan2013@... Other member nations of ITU Region 2 can get the contact info for their ITU go to person at http://www.iaru-r2.org/directory/ There is one change that concerns me deeply. Currently, 40M narrow band modes are used from 7,000 KHz to 7,125 KHz. The proposal is to cut this down to a 40 KHz section from 7,000 KHz to 7,040 KHz. Please get involved by voicing your opinion! Please share this information with all your amateur radio friends ASAP! Very 73/72 de KU4GW Cliff

4030. PFR-3 For Sale

Yahoo group: pfr3_group
Date: 2013-02-21 18:08:00 UTC
From: Stan ae0sl
Topic: 938 Message: 4030

I wanted to offer my PFR-3 to this group for a few days before putting it on ebay at a higher price.

==========

I have a well-loved PFR-3 that is available for sale. It works perfectly and has been in a non-smoking home with just a few expeditions to local parks. I am a full-time QRP CW operator, but the PFR-3 has just been sitting on the shelf since I bought a KX3 in December.

There are minor imperfections in a couple of the decals, but I am including the second sheet of decals. I will part with this fine radio for $210 plus shipping charges of $12 using Paypal to stanleeson@.... If you pay with a money order or a check (with 10 day delay to let the check clear), I will discount the price by $10.

Stan,

I will take this email to our club meeting tomorrow evening and see if any of the guys are interested in your PFR-3. The Black Widow is performing admirably. Love it.

There is a whole lot of air time spent attempting to attain "THE BEST".... one of these.. or those. Now.. with the understanding that "THE BEST" is a personal preference sort of thing. There are ways to measure the ability of this radio, or that radio.. to ascertain which does a specific task best.. as measured...this way... with this equipment, that is NIST traceable standard. Most folks don't want to do that type or detailed a process to measure "THE BEST". So... that being said, I will put it this way.I have measured a large number of QRPkits and KD1JV kits, and Elecraft kits.Each has its own footprint, and each holds its own in its own special way. IF I had to pick a particular rx... that hears the most sensitive, with the least amount of background noise or noise floor.Specifics please.... The MDS ... from the KD1JV kits will usually come out better by a db or maybe two over the more sophisticated radios. HOWEVER.. the KD1JV designs rely upon an effective xtal filter to keep the audio controlled when the band is crowded. The K1, K2 Elecraft radios utilize a whole lot more than that.. and it really is unfair to compare a multi hundred dollar radio to one that prices very nearly a single hundred dollar bill. Yet... you will be surprised, by the amount of contacts you can make with the radio that you got for $100 or so, if it is a KD1JV design, or one from QRPkits. Now, to be fair, I haven't measured enough of the "other" kits to make a full blown side by side comparison... if some one wants to see that... I intend to keep the specs and will present that at a later date. I think I would prefer a TriBander.. or PFR3.. for the field work, unless I am cramped for space or weight.. then the MTR or ATS series jump to the front, and usually into the pocket. The new Survivor, hasn't been tested.. but the lineage suggests it will be a player to contend with. Is anyone interested in deeper more specific details? I may be able to present something like that, later.. with more radios to average in, it becomes more valuable.

Have a great day,

IMHO, the best QRP radio is the one that your built from scratch from the ground up. In my case it is one of Jim Kortge's designs - the 2N2-40.

Building it was the greatest accomplishment in my amateur radio career. te receiver is so quiet that for several days I thought it wasn't working, it was so quiet. Then I tuned acrtoss a booming DX signal form Germany, and darn near had a stroke!

I have several QRP radios including the PFR3, and the Weber Tri-Bander from QRP kits, an ATS-1 residing in its Altoids can, and I think all of the products put out by SWL. Trying to optimize your radio ex ante is extremely costly, you just miss too much fun agonizing over the differences, Just pick one and go fer it! I have far more fun with my little QRP rigs than I dow with my big station built around the IC-781.

Dale:

This is very interesting and I appreciate your write-up. Sounds like you put a lot of work into this analysis. Realizing this all takes time, it would be nice to see more on this subject. Of course, as your time allows.

I have a K3 and PFR-3a and have very much enjoyed using both radios for different reasons. Love the simple workings of the PFR-3a and the ease of going portable. I do use a "full size" key, but other than that, the PFR is so easy to take on outings. Both radios were kits... However, soldering a kit like the PFR and seeing it "come alive" as each stage is completed is very satisfying. I did enjoy assembling the K3 and it provided confidence to perform future upgrades.

As has been said, each has their own preferences as to what makes one rig better than another. Although I have a K2 which I use quite frequently, 200ma receive current is a significant amount of current from a battery and a few solar panels.

The PFR3 is much better and if you can get one of the SW series rigs and replace the amplifier with the recommended upgrade, you can get down to 20ma or so of receive current. Batteries last a lot longer at 20 or 40ma receive than 150 or 200 ma.

My 2 cents

The MDS ... from the KD1JV kits will usually come out better by a db or maybe two over the more sophisticated radios. HOWEVER.. the KD1JV designs rely upon an effective xtal filter to keep the audio controlled when the band is crowded. The K1, K2 Elecraft radios utilize a whole lot more than that.. and it really is unfair to compare a multi hundred dollar radio to one that prices very nearly a single hundred dollar bill. Yet... you will be surprised, by the amount of contacts you can make with the radio that you got for $100 or so, if it is a KD1JV design, or one from QRPkits. Now, to be fair, I haven't measured enough of the "other" kits to make a full blown side by side comparison... if some one wants to see that... I intend to keep the specs and will present that at a later date. I think I would prefer a TriBander.. or PFR3.. for the field work, unless I am cramped for space or weight.. then the MTR or ATS series jump to the front, and usually into the pocket. The new Survivor, hasn't been tested.. but the lineage suggests it will be a player to contend with. Is anyone interested in deeper more specific details? I may be able to present something like that, later.. with more radios to average in, it becomes more valuable.

Hello All,
I too agree there is more than radio performance, they all seem to be in comparison within a certain price range. However the kit i built (PFR-3) is very speacial to me es enjoyed performing testing along the way, a great learning exp. fer me. i also like the idea of using one antenna (the Lamda wire) for all 3 bands. One of my favorite qrp rigs is an MFJ-9440X wid cw module, rock solid 10 wts ssb 5 wts cw, need to tune up and aligien, simple es get to use some equip. only 40 meters but the whole band. fits in a back pack fb.

Dale,

I for one would enjoy seeing your comparison chart of some of the other QRP rigs. I have my PFR3A and am tickled pink with it and have had a NORCAL 20 which I converted to 40m with Dave's help, and two 817nd's and two K1-4's not to mention two 706's, (mark I and 2) FT-857D and a K2/10 and K3/100 (now).

Tnx, de k6mgo, Bill

Yep, it is a long drive for a calibration.Tell you what tho... that will pop into a priority flat rate small box, and ship for about 8 or so...I'll calibrate it, and check the operation of it... make a spec sheet for it... then send it back.Won't take very long either, so for less than 20, you can have it all calibrated and ready to run...

Hey Dave, How about this.. go on and finish the rest of it. Then it will be somewhat more protected in the shipping.. but you can leave off the knobs and extentions. They stick up too high for a flat rate box to fit comfortable.Then I can check all of it.. at the same time, k?

Dale,
Looks like the parts I need are a 47 cap for C45 and a 470 PFD Disk Cap (471) for pins 3,4 of U3.
Let me know if you need anymore details.Thanks,Matt

4064. Older PFR3 kit instructions, errata, etc.

Yahoo group: pfr3_group
Date: 2013-03-22 15:59:58 UTC
From: zigmundrat
Topic: 4064 Message: 4064

Hi all-

I've acquired an older PFR3 kit, which appears to be complete and all, but I do not have assembly instructions or errata. The current docs on the website are all labeled PFR3A, and I don't think they apply. The circuit board itself is silk screened Rev A 2/9/08. That's really all the identification I have. I think this means it's a first run kit, not a Rev B, or a 3A. Assuming that it's a real Rev A, I have looked in the message archives here, but just want to double check things.

I did some Googling around and found various manuals, and also the Rev B.2 manual (9/22/08) in the files section. I assume the B.2 manual is the best to use, but would like to verify. I also found Steve's note to the QRP-L group regarding the firmware change, and note about the tuner windings. At this point I'm not aware of any PCB errors or things that will cause serious issues, but I haven't gone through the whole B.2 manual yet.

In summary, if my ID is correct, then I think I'm good to go with the B.2 manual, the updated firmware file, and the tuner mods. Does that sound right?

Thanks!

Hello Paul,

Yup, the rev. B.2 manual is the last release for the PFR-3 and the one you want. The previous iterations were pretty 'buggy'. Even in the B.2 manual there is at least one error, in the schematic, but that won't stop you from successfully completing the PFR-3 kit.

I believe you will be fine with that manual, if you find differences in the board, you may be able to compare with the schematic to solve the question. Attached is another manual that I use at times with some of the older boards too (may be the same as the one you have).Good Luck,

Have a great day,

Thanks for the reality check guys, I appreciate it. If I run into any significant issues, I know I can always ask here. Oh, and Dale, the file you attached looks like it's a newer one for the PFR3A and has a date of 12/19/09. Thinking that's not the one you intended.

I'm certainly looking forward to getting this assembled and trying it out in the field.

Topic: 4070 Message: 4070

FWIW, There was no Rev. B.1 manual (that I could ever find).

The chronology for the PRF3 (no suffix) manuals is:

"The PFR Portable Field Ready radio Preliminary manual" (File date indicates 04/2/2008)

"Production manual 6/10/08 Rev B" (the version attached to previous email.

"Production manual 6/10/08 Rev B.2 September 22, 2008" (the last revision for PFR3 (no suffix))

Rev B.2 is the manual that most closely matches the original radio.

There is a "cut and jump" mod required on the original "3" boards at the processor. This routes 5V to the proper A/D pin. This should be illustrated in the manual.

It will work without the fix, but will glitch by changing bands on you at random times. The changing bands problem can persist even after the fix and it seems some are more prone then others to do this. A reliable fix for anyone who still has this problem is to add a 0.1 ufd by pass cap to the push button switch A/D input pin. The easiest place to tack in this cap is across the "Menu" push button.

Steve and pfr3 group,

I disagree. I use my PFR-3A in the field and on my desk. Those original paddles work great, are small and very light. I also have a Black Widow which is beautifully made and beautiful to look at. However, I much prefer the original PFR-3 paddle. It's angled mount makes it much easier to use than the Black Widow (as long as one keys with the right hand!). I don't have to hold the PFR-3A with my left hand while sending. The Black Widow sticks straight out so that the radio itself is at an angle. I also have to hold the radio while keying. When I bought my paddle at Dayton 2 years ago Dale told me that I might be buying one from the last run. Glad I was so fortunate.

Topic: 4075 Message: 4075

Hi Paul, The Bitx 20 is a 20m ssb only hole through design, while the Survivor is a 75m ssb with cw ability hole through design. The Survivor has a support group too, combined with other KD1JV designs at pfr3_group@...m .Both are supported by Hendricks. Personally, I have had less trouble bringing the Survivor to operation within published specs, but that may be just me. A consideration may be when you intend to operate, the Survivor wouldn't be very good, if your operatiing time is near noon only.The Bitx20 wouldn't be very good if you can only operate during darkness hours. Good Luck with your build,

Have a great day,

Subject: [BITX20] Bitx vs Survivor

Has anyone considered the

KD1JV Survivor 75m SSB transceiver also offered by Hendricks?

I note this is Bitx group, as a newbie I felt the Survivor is an easier lot to start with. Yet Bitx I note seems better supported online. Any suggestions, advice as to which way to go?

Thanks

Fully assembled but no RX or TX, just ”white” noise from the phones. Passed group 1 smoke test with exception for the DDS verification. I have checked the voltages and found that some are completely wrong. See attached PDF-file. I am new to amateur radio so my knowledge is very limited and I cannot define what is causing the voltage deviations. All help would be greatly appreciated.

Best regards,

Lars-Goran

Hello,

If your radio did not pass the DDS tests, check the voltage at the output of U10. It must be very close to 3.5 V. Next, check the placement of U11. There have been boards released with U11 not installed in the proper orientation.

Best of luck and

73.......Steve Smith WB6TNL

Hi Lars, Maybe I can help out a bit. Could you also measure the voltage supplied to the radio, and pin 1 and 3 of U5 and U10? Going directly to the Group 1 tests, what do you see on the display when you first turn it on? Does tune up or tune down change the display? What was it that failed in Tests 1 about the dds checks?
Have a great day,

Subject: [pfr3_group] No RX or TX

Fully
assembled but no RX or TX, just ”white” noise from the phones.
Passed group 1 smoke test with exception for the DDS verification. I have checked the voltages and found that some are completely wrong. See attached PDF-file. I am new to amateur radio so my knowledge is very limited and I cannot define what is causing the voltage deviations. All help would be greatly appreciated.
Best
regards,
Lars-Goran

Hello Dale,
Supplied voltage: 11.8V
U5 pin 1= 11.5V pin3= 5.0V
U10 pin 2= 5.0V pin 3= 3.52V

When I turn it on I first see 40 followed by 030.0 on the display
Tune up and down works and so does the keyer.
The function of the DDS coould not be verified because I don't have a frequency counter.
Best regards,
Lars-Goran

Hello Dale,
In the test 2 I went directly to the BFO trimmer set because I do not have an oscilloscope or frequency counter. However, the tone from the BFO was so week that is was impossible to make any adjustment.
Best regards,
Lars-Goran

If you have a general coverage receiver with BFO, you can listen for the DDS signal with that. However, it sounds like the DDS is working and you have other problems. Possibly a short in the IF crystal filter.

Listen up, all you FOXii and Hounds...!! The FOXii are going to be out of their dens TOMORROW evening! Same time - 0100z til 0230z or 7pm til 8:30 pm Thursday evening.All the FOXii.. and ALL the HOUNDS.. are allowed to chase each other through the 40 AND 80 acre forests this time. And I have good faith that the Game Warden will be looking the other way..... he'll be so busy watching the Foxii.. and Hounds...that he won't notice if we sneak out past the trees marked 7030 and 7050.. and 3550 and 3570... I don't think a fellow wants to go very far..because it would be hard to keep anyone's attention. But checking just a tree or two would be ok...I'd guess. There is no log required by the scorekeeper this time.. however, posting by the Foxii.. would be nifty.. wouldn't it? So.. help spread the word, please, share. Let everyone know.. this IS the last FOXHUNT for the Season.. theFOXTRAVAGANZA will wrap it up. Y'all come, and have FUN!! Enjoy! See you there!!

Have a great day,

I have the original paddle and have used it extensively in field ops. Just clean the screw contact occasionally with a dollar bill. I also use a Black Widow in the home shack but prefer the original paddle. The company that machined the aluminum block portions stopped production. Therefore no more paddles. I still hope they go back into production.

Hi Ken,
I don't know of anyone now.. that does, for sure.. Ren used to.. tho.
Jerry stopped too. Let me see if I can find Ren's email.. Maybe he can?
He had a nifty one.. to me.. it was very nice.

Have a great day,

Thanks, Dale for the reply. Just wondering- I know that Hendricks doesn't supply paddles any longer - does anyone make a substitute?

73s,

Ken

4104. Wiring for battery pack

Yahoo group: pfr3_group
Date: 2013-05-30 22:49:01 UTC
From: synovial_98
Topic: 4104 Message: 4104

Hi,

Just looking for a little guidance here - just took delivery of a used PFR-3. All seems in order EXCEPT the battery tray was never wired. The rig came with the original assy instructions and they mention nothing (other than the jumpers on the batt holder itself) about terminating the output to the power switch or the PC board, etc.

Perhaps I'm missing a page, although it was all stapled together.

Any advice is welcome.

Thanks,
Ken

Hi Ken,
Let's fix it. k?
I figure the battery box(s) can be series together.. placed close to the edge.. caution.. be careful to measure
to avoid having to move them because they hit the components when you close the box.
Now to the wiring.. the black - ground lead goes under the power switch.. as does the positive - red lead.
When you place the radio, board up, bottom case off, with the power switch close to your tummy, and the tuner caps to the right, there will be three "holes" , with one red lead from the power jack. directly in line with that nearer the edge of the board.. not two holes but one away.. somewhat in the middle.. the batt plus hole will be. That's for the red lead. The black one goes to the right and closer to the edge.. it is looking for a ground, there should be one just to the right of and closer to the board edge than where the red one is.
You can use a vom to prove the ground... and.. the plus.
Good Luck,

Have a great day,

4106. Group 2 Smoke Test and BFO Trimmer questions

Yahoo group: pfr3_group
Date: 2013-05-31 13:13:27 UTC
From: kc9spw
Topic: 4106 Message: 4106

Hello All,

I recently finished my receiver and began the Group 2 Smoke test. I connected leads to both sides of the R1 resistor, red close to Q2 and black on the other side of R1. I connected these to the BNC connector (red to middle, black to case) and connected this to a 20m dipole antenna.

I did not perform the DDS calibration of IF offset calibration due to lack of required test equipment. I did however work to calibrate the BFO trimmer. Following the manual's procedure, I was able to enter "CAL.r" mode and heard the sidetone immediately. However, I was unable to hear the BFO signal. Also, it seems as though the antenna was not picking up a signal. Perhaps I've made incorrect connections to the BNC, antenna, etc. The power source I used was a 12v dry cell battery which I use with my other QRP rigs successfully.

The BFO trimmer did not have a "stop" per se, and easily traveled in continuous circles as long as I turned the screwdriver. Is this normal, or should there be stop points at the curved and flat sides?

Overall, I could hear the annunciations (code), the paddles worked, I could hear a soft hum in the headsets, and the display seemed to be working ok. I suspect BFO should be trimmed once the rig is completed and hooked up to a better antenna?

Does anyone have any comments regarding the BFO trimmer and lack of a BFO signal? Have I followed the procedure correctly? I'm happy so far and it seems that I'm on the path to greatness. Ha ha

Thanks and 73,

Scott

4107. RE: [pfr3_group] Group 2 Smoke Test and BFO Trimmer questions

Yahoo group: pfr3_group
Date: 2013-05-31 13:37:01 UTC
From: Dale Putnam
Topic: 4106 Message: 4107

Hi Scott,
With connection across R1, that pretty much eliminates Q1 and Q2 from the test, so sens will be a bit lower.
The bfo cap does turn without a stop. Close inspection of the cap will reveal an arrow, where you insert the tuning tool. If you start with that arrow pointing towards the edge of the board, that would set the origination point correctly. The "Calr" starting point calibrates the 10m osc. if you go past that point quickly.... then the bfo can be heard, too. Then bringing them together or "in sync" will be in order.
I use a little 9v supply for these tests.. just in case.... cheap insurance.

You're doing well, Scott, very well. You'll love the bright YELLOW box.

Have a great day,

4108. PFR-3A

Yahoo group: pfr3_group
Date: 2013-05-31 14:43:25 UTC
From: zyxtrum
Topic: 1407 Message: 4108

I bought a PFR-3A used. When it arrived nothing worked. I opened it up and noticed that the wiring had been done and redone, and that some of the wiring was in the wrong places, and a couple of wires were dangling loose, including the internal battery wire. I contacted the seller and he made it right by refunding enough of the money to cover the repairs, so kudos to him. (Won't mention names).

I bought some teflon wire and completely rewired the PFR-3A and then aligned everything.

My post isn't so much about buying a used radio as it is to praise this fine radio design for how well it works. I have an FT-817 and IC703 to compare it with and when tested with my Motorola Communications Monitor the PFR-3A's receiver was slightly better than either of the other two. It is much lighter and has a built in tuner that works extremely well and is simpler to use. I like the built in keyer, although you will need to practice your sending timing to get the memory messages to work properly. You can stick a Palm Mini paddle to the right or left side, depending if you are right or left handed, and forget about the paddle issue. The paddles on the Palm push inside the aluminum housing while in transport.
http://www.mtechnologies.com/palm/
So my portable pack just got a lot lighter, simpler and I am not giving up anything since I work 100% CW from portable locations.
I used this radio and an EFHW antenna to activate my last summits for SOTA and it worked flawlessly.

I see other guys on other groups wishing they had an ATS-4 or MTR. For my money, you can't beat the PFR-3A for a complete CW portable rig. Improvements that I suggest, provided it doesn't increase weight too much: Tuning knob with spinner for rapid and more convenient tuning, display with a little more information, and AGC. Oh and did I mention, you can order one and get it, unlike the ATS-4 and MTR. I will be ordering a new kit when the B model comes out in July.

I appreciate guys like Doug Hendricks and Steve Webber for bringing this fine beautiful yellow, American made gem to us.

Mike

4109. BLT Plus

Yahoo group: pfr3_group
Date: 2013-05-31 15:41:32 UTC
From: chebipb
Topic: 4109 Message: 4109

While not a primary objective of this group, I noted that the BLT plus tuner was mentioned in a thread.

I have a question regarding the BLT Plus as to its claim for use with balanced and unbalanced coax cable.

The wiring of the Dummy load resistors shows 3 resistors of which two are in parralel therefore offering a load resistance of 75 ohm with a balanced line as it shout.

When switched to Coax however, the switch just grounds one of the legs of the antenna but does not alter the dummy load of 75 ohm to match it with the ususal coax resistance of 50 ohm..

My question is: Should'nt there have been a 4th 50ohm resistor to be swiched in parrallel with R3 in the inbalanced (coax)option to drop the dummy load resistance to 50 ohm to match the coax resistance?

Is my thinking correct?

Thanks

4113. Re: BLT Plus

Yahoo group: pfr3_group
Date: 2013-05-31 20:24:14 UTC
From: chebipb
Topic: 4109 Message: 4113

For completeness I am attaching and email exchange I just had with Stephen Smith:

You are right as to "ONE" function of the three resistors forming a
balancing bridge during tuning.

However, you certainly would not use 2 watters if that was the only purpose
of these resistors.

IMHO these resistors form a dummy load ,as well ,during tuning , thus
offering a 75 ohm load for balanced 75 ohm lines which is correct, but would
also offer a 75 ohm dummy load as well with an unbalanced 50 ohm coax which
isn't correct.

Tuning in coax mode therefore is done with a 75 ohm dummy load , which was
the point I was questioning in my original post, and inserting the
additional resistor across R3 during Coax mode tuning, would not preclude
the bridge performing its function except it would then do it with a 50 ohm
load .

What say you?

Thanks for your fast response

Paul

Subject: Re: [pfr3_group] BLT Plus

Hello,

There should not have been a fourth 50 Ohm resistor because he three 51 Ohm
resistors are not a dummy load; they form an impedance bridge with one of
the 'arms' of the bridge being the primary of a voltage step-up transformer
for the LED indicator. When the impeadance is 51 Ohms, the bridge is
balanced and no voltage appears at the transformer primary; otherwise the
bridge is unbalanced and the voltage at the transformer primary is
stepped-up to forward-bias the LED indicator.

4114. Re: [pfr3_group] PFR-3A

Yahoo group: pfr3_group
Date: 2013-05-31 22:03:27 UTC
From: Matt VK2RQ
Topic: 1407 Message: 4114

It was briefly mentioned on this mail reflector in August last year:

"The new PFR-3B under development will differ from the earlier versions mostly in it's mechanical design, which is quite a bit different from the original. Some circuit changes in the wiring of the processor were required to accomidate the change to rotory tuning and an improved audio AGC circuit is used. "

I don't recall a release date ever being mentioned, so it's interesting to hear that something may happen July.

Steve is correct. There is no "PFR3-B".
However, according to my direct communications with Doug Hendricks via
email, there will be a "PFR-3B" out around July 1st.
Perhaps if what I am saying is not true regarding getting the email
directly from Doug regarding the "PFR-3B", I buy Steve a current PFR-3A.
However, If what I am saying is true then Steve buys me a new "PFR-3B"
when they come out.
What do you say Steve?

Hi Dale! (WC7S)

Thank you for the encouragement.

I did see the arrow as you mentioned and followed the procedure according to the manual. Perhaps I got a little over zealous with the screwdriver during my initial turns. I'll "reset" it pointing towards the edge of the board and start from there. Thanks for the suggestions.

I started out with a 9v supply and moved on to more voltage. My rationale was bringing the board close to operating voltages. I see the wisdom in your suggestion of "good insurance" though and will step back down a few volts. hi hi

I'm just about completed with the transmitter portion and moving on to the next steps.

73,

Scott

> I recently finished my receiver and began the Group 2 Smoke test. I connected leads to both sides of the R1 resistor, red close to Q2 and black on the other side of R1. I connected these to the BNC connector (red to middle, black to case) and connected this to a 20m dipole antenna.
>
>
>
> I did not perform the DDS calibration of IF offset calibration due to lack of required test equipment. I did however work to calibrate the BFO trimmer. Following the manual's procedure, I was able to enter "CAL.r" mode and heard the sidetone immediately. However, I was unable to hear the BFO signal. Also, it seems as though the antenna was not picking up a signal. Perhaps I've made incorrect connections to the BNC, antenna, etc. The power source I used was a 12v dry cell battery which I use with my other QRP rigs successfully.
>
>
>

4117. Re: [pfr3_group] Simple 3-band Antenna for PFR-3A

Yahoo group: pfr3_group
Date: 2013-06-02 12:28:21 UTC
From: lahagar1@...
Topic: 4104 Message: 4117

I finally got around to trying a 5/8 wavelength vertical wire on 20m with the PFR-3A. The 42 foot (12.8 meter) long end fed wire antenna has a banana plug that connects to one of the balanced line terminals and is tuned using the internal Balanced Line Tuner (BLT).

This wire antenna is simple and about optimum length for low angle radiation on 14MHz when installed vertically (as I tried to do). And the 42 foot wire works well on 30m and 40m too. On 30m the antenna is a 0.43 wavelength vertical. On 40m the antenna is 0.30 wavelength.

The SWR indicator indicates a good match (complete darkening of LED) on all bands without a counterpoise wire or ground connection using the BLT.

I recorded an example of the antenna being used yesterday QSO on 30m with N8MRS/Mike in Akron, OH who was using his new Ten Tec Eagle. Even with the solar disruption and poor band conditions we still managed a nice QSO, that was finally ended only because of rain: http://youtu.be/XeOwP7JtAPU

From: Dale Putnam
Topic: 4121 Message: 4122

Hi Bob,
The encoder requires a few components in the middle of the board be relocated to the back side, and the rest be mounted very close to the board. The encoder mounts onto the front cover, is wired to the board that is then mounted to the case. Located in the middle, just adjacent to the digi display, nearly centered top to bottom. Looking at the front case the encoder knob and display are to the right of the tuner section.
Extreme attention to fit and location, is dependent on the component placement of the main board, and the close fit of the encoder.
You may find it much easier to accomplish if you plan ahead and mount the majority of components of the main board on the back side, during the initial build, in that centralized area of the main board. That would then allow a bit more flexibility in location of the encoder without issue.
Good luck, this can be a nice feature for those that would rather twist than push.

Have a great day,

From: Bob
Topic: 4124 Message: 4124

Completed the build of the DIY4FUN encoder but think I like the stock tuning better. Looks to be a pretty tight fit to mount the encoder inside the case but it should fit nicely in a small, separate enclosure. Documentation and pictures available. Asking $35 including shipping in the lower 48. Not sure if these are still available from Miroslav or not. Contact off-list at k9foh at comcast dot net. Cheers, Bob

4126. A few more FOXii

Yahoo group: pfr3_group
Date: 2013-06-27 01:58:07 UTC
From: Dale Putnam
Topic: 4126 Message: 4126

In order to balance the spread of the FOXii, during the summer season,

we are looking for ajust a few more FOXii.. Here's the deal. Go to the webpage, and

find the link to the apps.. fill it out.. send it in.. even if you have never done it before..

the summer season is a great way to gain a bit of experience.. and a whole lot of

fun time... not to mention.. the dreaded butterfly time... but then we all get that..

What say, some of you have been hounds for a long long time.. now's the time to

jump in and be on the other side of the den door.... or is that the other side of the din????
You'll never know.. until you fill out an app.. .. .. ..

Might just as well fill it out.. and .. of course, the committee doesn't have to pick you..

so.. you could just fill one out and be on the standby list.. and that's ok too.

And for the rest of the hounds.. are you really ready????

Have the key contacts polished clean, the antennas all checked over.. and the dust off the earphones? ? ? Really?

We don't do teams for the summer.. just for the winter season.. but daylight is burning..

might be fun to keep your ears open for possible team members ??

More fun.. in 90 minutes.. than you think you can have...

shoot.. I think it is more fun than anything else... with my boots on.. .. .. ..

http://www.qrpfoxhunt.org

Have a great day,

4127. EAR BUDS

Yahoo group: pfr3_group
Date: 2013-06-27 23:40:28 UTC
From: beargyrils@...
Topic: 4127 Message: 4127

I been paying $20.00 for Philips ear buds.
They sound good but would last about 6 months then one would go out.
I was in Staples yesterday and I saw a set of ear buds for $9.99.
I hooked them to my rig and they sound like they have a built in audio amp.
I tried them on the Hb1B,FT 817 and my FT 857-D,and the China rigs.
I saw some ear buds selling for $69.99.
These have to be the best sounding ear buds I ever used.
Their called EchoUnltd and CW seems so much better sounding.
Can't beat the price.

We have a place called Microcenter nearby that has some "off brand" earbud like units for very low price. They are next to the checkout line to tempt impulse buying. So far they are the best I have used. They were substantially louder than anything else I have tried. And they are NOT distorted in the raised volume.

These BUDS I have are made in Vernan,NJ.
Like the ones you have they are super loud and I no longer need that
little audio AMP I use now and then.
First set I ever had where I had to turn the audio slider down on this lap
top.
Others that looked almost the same were $49.99 and up for those tiny
things.
$9.99 and a 1 year warranty.
Can't beat that.

4130. PFR-3 varicap hardware

Yahoo group: pfr3_group
Date: 2013-07-04 21:19:41 UTC
From: Bob
Topic: 4130 Message: 4130

I purchased two PFR-3's and two Buddy Keyers at Dayton this year. The PFR-3s were missing the hardware for mounting the knobs to the varicaps and the good hookup wire. Used excess wire from the keyer kits to finish one PFR-3 but still need some more for the second PFR-3. Did anyone else find this part shortage? I think Steve said there were nine PFR-3 kits at Dayton. I've tried contacting QRPKits at their web site via email and phone calls but get no response. I did locate some screws and spacers that will work. The size of the screw is 2.5mm with the length a little over one inch. Found the screws at Fastenal and I think they are more than just a local Lafayette, Indiana company. The spacers were from my junk-box. Cheers, Bob, k9foh.

Here are the first two FOXii up for skinning... in the Summer Season of FOXHUNTs

This very next Thursday (local), starting promptly at 0100z (Fri - GMT) or 7 pm MDT, +/- 10KHz from 14.060,

these two skilled, sly, swift foxii, will be emerging from their dens, and it will be up to you to find and grab

a pelt (qso) from each of them. There will be only two, and the following week a different two, continueing for

the entire summer season. 10 weeks, each Thursday. So dust off that qrp gear, oil up them keys, and lets get to it.

Take a look to the sky, to the last thing your shot will touch, until it smacks a FOXii, hopefully deadon. We have only

FIVE DAYS LEFT....

Whew, it has been a long dry summer, my FOX withdrawl was getting unmanageable... how about you?

See you in the pack of hounds... and good luck to all and to all a good hunt.

Have a great season,

4133. Low Power Output

Yahoo group: pfr3_group
Date: 2013-07-07 20:17:42 UTC
From: CDawg
Topic: 2609 Message: 4133

I have a PFR-3a that I started building years ago (2008, maybe?). I got up to the point where you wind the BLT toroid and had to put it aside, as other priorities took over. I never got around to finishing it, until this weekend. I finished up putting the remaining parts on the board. When I got to the final checkout before putting it in the box, I got some pretty low power readings:

40M - 0.05 watts
30M - 0.25 watts
20M - 0.60 watts

I haven't done anything further with it yet. Sometime this week, I'll go back over everything I installed since the last successful test.

Oh well... Let the troubleshooting begin! :-)

4136. Re: Low Power Output

Yahoo group: pfr3_group
Date: 2013-07-08 19:05:23 UTC
From: CDawg
Topic: 2609 Message: 4136

Thanks to those who replied off-list with suggestions.

I powered up the rig this afternoon to rule out a suspect piece of coax cable going to the watt meter and dummy load. The low power problem still existed. I measured the rig's current draw. When keyed, it appeared to be drawing about what I would expect -- in the neighborhood of 800ma.

Things went slightly downhill from there. At some point, I couldn't key up the transmitter at all any more. It doesn't seem to be recognizing paddles or straight key when connected. I can still hear sidetone when I change from iambic A to B, etc., though.

In any event, at this point, I'm going into inspection mode to see if there are any obvious problems I can spot.

The saga continues... :-)

The summer fox hunt season begins tomorrow, Thursday evening at 8 pm CDT (0100z Friday, August 12). Your foxes are Paul, K4FB in FL, and Todd, N9NE in WI. The hunt lasts for 90 minutes and takes place between 14.050 and 14.070. Both foxes will operate split (usually up 1 KHz or so) but may go to simplex later in the hunt. A description of the hunt and its rules are found on the QRP Fox Hunt website at http://www.qrpfoxhunt.org/

You are cordially invited to join in on the fun!

Have a great day,

Remember the first cell phones.. called pack phones? Had a nifty
case with a carry strap?... that fits the PFR3 just great.. has room for a
roll of Teflon wire, and logging pad, with leftover room for a snack.
Velcro closer too.
OR..
I sling it into the saddle bag, when I saddle up.. and ride over the next hill.
Have a great day,

I use a tablet pc rubberized cover.
Protects it well and is not big fitting correctly the PFR-3s size.

I made a small box by wood.
I uploaded some photo in album. It's easy to operate when open a box.

I tend to use 24' radiator and a 24' counterpoise with my K1 and KX1 for those bands...maybe it would also be ok for the PFR3?

I use a small camcorder case. Padded and protects the rig. Lots of pockets for things like a wire antenna and such.

Hi Brad,

The simplest single piece wire antenna I have found that can be tuned on all three bands using the PFR-3A internal tuner is a 42 ft end fed. It did not require a counterpoise in this set up:

http://www.youtube.com/watch?v=XeOwP7JtAPU&feature=share&list=UURdA_pzS1kJ3LEr2qP9jPHw

Up to about 5/8 wave length is the maximum length for low angle radiation when installed vertically. Longer vertical antennas will develop high angle radiation lobes. So on 20m, if you install a vertical wire too much longer than 40 feet it will be somewhat less effective for DX.

However, low angle radiation is not always the most desirable. It depends on how you want the RF reflected. For higher angle radiation, the wire can also be bent over at an angle, more horizontally.

Installed in that manner, or in an inverted-L, that opens up the possibility for using other lengths of wire too. I have found that other lengths can be tuned on all three bands with the PFR-3A directly as end-fed with/without counterpoise or with various open or coaxial feed lines.

But this single piece wire, about 42 feet long, is probably one of the simplest that offers good performance.

FOR SALE:
A complete, working, guaranteed, ready to go with you... AT3a meets specs... actually does better.
Been mounted in two or three different boxes, but now resides in a flip top blue striped home, that
houses both the radio and the extra filters.
More-Photos on request.
It is a fun little radio, been taken on vacation to N. C. so it went through local air worthiness inspections.
Has never been packed around on foot, but give it credit for miles flown.
I want everyone that wants this cool radio to have a chance at it. This is how it will work this time:
I will take offers, direct email, not through any reflector, or by any other means, through Sunday evening 7pm MT or
0100 z. At which time the offers will be evaluated. The chosen winner will be contacted immediately, and the radio will be
shipped via Priority Flat Rate on Monday morning. So, if you make an offer, and expect to win, pay attention to your email
on Sunday evening. This will provide access to all for the rest of today and two more days.
Understand that my financial situation demands this and likely other radios too... and I am not entirely happy with letting
go, so convince me that the little guy will be taken good care of, too. The highest bidder, that doesn't convince me that the radio
will be cared for... won't win. No points aren't taken away for spelling errors, either, but multiple bids from the same originator
lose points rapidly.
Thank you for the bandwidth, and keep responses direct, please.

Have a great day,

Nice U tube movies Lynn.
About the end fed I use nothing but 65 feet of wire.
Another time I used that wire and put the tuner on it ant got it darn near vertical with a kite.
I then put on 86 feet of coax and the kite pulled it up with no problem.
The only thing you can't do it retune when that tuner is up there..
I was told the more wire,the higher wire will get more contacts because you have more capture area,but I have used shorter wires with a UNUN but I noticed right off the 65 foot wire did much better
Just my 2 cents worth on the topic.

4153. Iambic B

Yahoo group: pfr3_group
Date: 2013-07-28 01:12:30 UTC
From: CDawg
Topic: 4153 Message: 4153

I finally got my PFR-3a on the air today. Steve Weber managed to spot a stupid mistake I made and, while he had the rig, he upgraded the firmware to the latest version and did the calibration. If I don't get rained out tomorrow, I'll give it a field test in the FOBB contest.

Has anyone noticed any issues when using the keyer in iambic B mode? I've been using mode B for many years with a lot of different keyers. When I squeeze both paddles simultaneously, I expect to get alternating didahdidah... or dahdidahdit..., depending on which paddle was pressed first. However, in this rig, I only get a steady dashes, regardless of which paddle was pressed first. Iambic A appears to be operating normally (although I never really used the A mode.) I've tried several paddles with the same results.

If you're the kind of CW op who sends a character "C" with four distinct, alternating paddle presses (i.e., finger-thumb-finger-thumb), you'd probably never notice what I'm talking about. If you use the iambic feature and send a C with two simultaneous paddle presses (finger-thumb then held together), you would see this, if it exists in your rig.

Just curious if others have seen this. For now, I guess, I'll use an external keyer.

Otherwise, it looks like it's going to be a fun little rig.

From: CDawg
Topic: 4153 Message: 4159

Dale:

When I put it in B mode, I see the issue mentioned in my first post. When in A, it seems to be operating normally.

From the manual:

"In B mode, alternating code elements are also sent when both paddles are closed, but this time an extra and opposite code element will be tacked on the end of the string when the paddles are released. Therefore, to send a letter such as "K", you just have to close the dash paddle first, then close the dot paddle and release both paddles when the dot starts to be sent. dah-dit-dah will be automatically sent."

The description of mode B in the manual is correct, however, it's the alternating code elements that I'm not seeing in mode B. Instead, I'm getting a string of dashes when both paddles are closed simultaneously.

From: Dale Putnam
Topic: 4153 Message: 4160

Hi Craig,
That makes me lean toward reprogramming the processor. Might be Steve could help? He's closer.
Have a great day,

--... ...--
Dale - WC7S in Wy

To: pfr3_group@yahoogroups.com
From: wb3gck@...
Date: Sun, 28 Jul 2013 11:59:21 +0000
Subject: [pfr3_group] Re: Iambic B

Dale:

When I put it in B mode, I see the issue mentioned in my first post. When in A, it seems to be operating normally.

From the manual:

"In B mode, alternating code elements are also sent when both paddles are closed, but this time an extra and opposite code element will be tacked on the end of the string when the paddles are released. Therefore, to send a letter such as "K", you just have to close the dash paddle first, then close the dot paddle and release both paddles when the dot starts to be sent. dah-dit-dah will be automatically sent."

The description of mode B in the manual is correct, however, it's the alternating code elements that I'm not seeing in mode B. Instead, I'm getting a string of dashes when both paddles are closed simultaneously.

4162. PFR3 paddles for sale

Yahoo group: pfr3_group
Date: 2013-07-30 04:51:19 UTC
From: Joel
Topic: 4162 Message: 4162

Greetings to the group,

I have one of the original PFR3 radios, and I purchased the custom paddles for it that fit on the front.

I am upgrading to a different set of paddles, and will not need these any more.

If anyone is interested let me know (you can email me directly if you wish). I don't remember what I paid for them originally, but I was thinking $25 + shipping. I do have PayPal.

Let me know if anyone is interested,
Thanks,
Joel

Subject: [pfr3_group] PFR acting up

I haven't been on the air for a while, the kitchen was under construction and my new station is in the corner.
I hooked up my PFR3 and it seems to be stuck in tune mode. The rit button seems to turn it of and on. And the freq buttons seem to do what they are supposed to.. Any ideas of what I should try. I have cycled all the buttons, turned it off and on to no avail. Is there a reset procedure for

4172. QRP freq's and working in the U.S....?

Yahoo group: pfr3_group
Date: 2013-08-11 18:09:01 UTC
From: Andreas
Topic: 4172 Message: 4172

Hello folks,

thanks for reading. I have vacation starting in near future and want to be active on QRP CW in the United States, especially CA, NV, AZ.

I hold an us-call a long time, it is AB7VT. But haven't been in the states for more than 10 years now.
Maybe anyone can help me here in the list:

What are best CQ QRP frequencies? Have read 7030 and 7040?
Is there something else important to know?
Do I have to work as W6/AB7VT while in CA?

Thanks again for upcoming help.
Anything will be appreciated.

73, Andy, DL1AKP / AB7VT

Hi Andy,

I'm no expert, but do believe that the FCC has given up completely on the call sign thing. By that I mean if you live in "6" land you can get a call in 1,2, 3 or any other district if you want it and it's available. Now days you don't know where the person you are talking to, is located. So you don't have to ID as a W6/ as far as I know.

And yes the QRP calling freq. is now 7.030 but a lot of guys still us 7.040, although some of the RTTY people have moved onto that freq so you might encounter them.

If you operate 20m, then 14.060 is the best bet.

73, Bill, k6mgo

Andy/Bill,

I was reading the FCC regs part 97. Bill, I am no expert either, but I do think you are correct. Since Andy is not operating with a reciprocal license (i.e. not Part 97.107), and instead he is using a USA issued license then I think he can just go about the USA and sign AB7VT. If he is in California there is nothing wrong with tacking "/6" afterwards to indicate that too. I hear that kind of identification a lot from portable or mobile stations. It is a nice carry-over from when the USA call areas actually conveyed some kind of geographical information.

I have heard, and can understand the problem with, signing "/P6" for "Portable California" or "/M6" for "Mobile California" because each of those (so called self-assigned) letters could be interpreted to be country prefixes (Indonesia and England).

I worked a guy in a Los Angeles park who tacked on "/PM" to his call. He was trying to communicate that he was "Pedestrian Mobile", but instead he was, I think, violating 97.119. Of course I had a pretty good idea he was not transmitting from North Korea, but technically he was in violation of FCC rule 97.119(c). He could have just transmitted "/6 portable" or just "/6" and been compliant with the rules.

"§ 97.119 Station identification.
(a) Each amateur station, except a space station or telecommand station, must transmit its assigned call sign on its transmitting channel at the end of each communication, and at least every 10 minutes during a communication ... (c) One or more indicators may be included with the call sign. Each indicator must be separated from the call sign by the slant mark (/) or by any suitable word that denotes the slant mark. If an indicator is self-assigned, it must be included before, after, or both before and after, the call sign. No self-assigned indicator may conflict with any other indicator specified by the FCC Rules or with any prefix assigned to another country."

http://www.arrl.org/part-97-amateur-radio

Andy, hope you have a great vacation in USA.

Also, don't forget 30m for fun CW QSOs!

73,
NG9D

Hi,

thanks both of you! That's good that the designator /6 is no longer mandatory. I think I learnt that in licensing about 1996.

Thanks for information about frequencies, I will keep an eye on 30m, too. Think the freq there is 10.116, isn't it? I will use my yellow box and a doublet antenna with 24ft. fiber stand.

Our trip will start in Las Vergas,NV, then going to Yosemite, San Fran, LA, Hoover Dam, Grand Canyon, Utah. Hope, I can make a few fine CW QRP contacts!

Hi Roy,

The ARRL says that for countries that have a reciprocal operating agreement with the US, the FCC allows foreign amateurs to operate with no permit if you carry your foreign amateur license and proof of your citizenship in that country. Identify using "W" and the number of the FCC call letter district in which you are operating followed by a slash and your non-US call sign, e.g. W6/GM4VKI.

Nice summary on ARRL web site:

http://www.arrl.org/foreign-licenses-operating-in-u-s

Have fun.

73,
Lynn

Many thanks Lynn.

W6/GM4VKI it is then.

hi everybody
whilst im on ive just about finished extensive modification to my PF3 in so much as
1 Rec RF amplifier (makes a big difference)
2 variable bandwidth xtal filter (listen to SSB)
3 BFO freq swinging (SSB Tuning)
4 Variable AF selective filter tuning (easier on the ears)
5 Rec RF bandpass filter addition switch Cap to make the tuning cover a wider bandwidth
Ill be writing it up for the GQRP Sprat magazine if you wish to read it when i've finished . (allows better rf peaking)

best 73's all
Roy

Hi David,

This was the last word from Steve KD1JV (posted nearly a year ago):

The new PFR-3B under development will differ from the earlier versions mostly in it's mechanical design, which is quite a bit different from the original. Some circuit changes in the wiring of the processor were required to accomidate the change to rotory tuning and an improved audio AGC circuit is used.

Looking forward to seeing the new kit, I'm getting itchy about building something again...

GA,

I have a PFR-3 for sale, I'm retiring soon and need to thin out the shack before I move. I didn't build this one, bought it from a ham in CA. Works well, but I'm an impulse buyer it seems. I already have a KX1 and love it.

This is a special deal here, it comes with the original paddle Doug sold, plus a W5JH Baby Black Widow paddles. I don't want to break up the set here, so don't ask, please.

I also purchased from Doug a new painted and silk-screened case for it ($40.00), which I have not installed.

I'm asking $ 250.00 for everything, and I'll pay shipping. Contact me off line at my email address.

Thanks.....73 de Ed

Hi Steve,

Yes, the silk-screened case is part of the deal ! I can do PayPal, or postal money order if you prefer. I can't ship till Tuesday because of the holiday.
As with all electronic sale, no refund or return, it won't be DOA. I will insure the package for the value.
Hope this helps you, thanks....Ed

If we are going to stay with yahoo can we make the best of it by changing the picture in the header to be more relevant to this sight?

Hi Steve,

When I log into the PFR-3 group I see a picture of some kind of woven hats with a title that says "PFR-3 Group"
I did not know the focus thr group has changed to hat weaving. LOL
I wish I had a picture of a PFR-3

Hi Brad,

I get the same result that you do if I am not logged-in to Yahoo and I go to the pfr3_group home page. In fact, the same thing happens on any Yahoo Group to which I am subscribed.

Here is the URL to the home page PFR-3 photograph:

<http://xa.yimg.com/kq/groups/22411776/homepage/name/homepage.jpg?type=sn>

There are plenty of others out there. QRPKits.com has the same photo. along with a rear panel view.

Hi,

Thanks for that - Personally, I can't see whats on the Yahoo site as yahoo is painful to manage with multiple email userid's, so as long as we keep a list that is able to send out emails, then I am really happy.

Just by the way, if the group would like cheap (as in free) hosting, I am very happy to provide it - I run a server for a number of other groups, including my clock making business (www.dougswordclock.com) and am happy to provide disk space and bandwidth if wanted.

Hi Brad.

I cleaned out a lot of Chinese hack crap yesterday. That's as far as I'm going to go right now. I have more important items on my agenda, like taking care of everything while my wife recovers from back surgery. If you would like take over group ownership I'd be happy to let it go. To be frank, this has gotten to be a big pain in the ass.

4196. Charging a super polymer lithium-ion battery

Yahoo group: pfr3_group
Date: 2013-09-07 17:49:16 UTC
From: <n1vwd@...>
Topic: 4196 Message: 4196

I won this battery as a prize at a ham gathering this summer. The battery package contained the battery and a wall wart charger but no instruction sheet to give info on the initial charge- length of time to leave on the charger etc. and subsequent further charging to get maximum capacity and battery life. The model # is DC 1298A
input 12.6VDC output 12.6 - 10.8VDC 9800mAh.
I tried looking it up on the web but all I came up with was a number of places to buy them but no info sheet.Does anyone in the group know about these batteries and the proper way to charge the for best efficiency? Thanking you in advance for any help you may give.
Tnx es 73

No it's not that simple! (This email will convey you are still stuck perhaps).

You have to go to yahoo groups main page to opt out. Note you can also maintain your access, but only turn off the email (which I do for nearly all my yahoo groups). See the Manage My Groups 'tab' on the left.

I stay in this one since I own a PFR-3.

Topic: 4204 Message: 4204

Dear Friends

On my PFR3 i include on my power jack a 1N4007 diode with a fuse case, this is for polarity protection.
I've some discuss about this procedure, some said that this is good modification, others say this is Not necessary and your'e changing the current consumption.
Any coments are vey wecolmed.
Thanks for reading

There is already a polarity protection diode on the PFR3 board - it is a shotky type so has 1/2 the voltage drop of a 1N4007. The one you added is redundant and not needed.

Adding the fuse is however, a good idea.

4208. PFR-3 Painted and Silk Screened Case

Yahoo group: pfr3_group
Date: 2013-10-16 14:45:12 UTC
From: <jhoonbee@...>
Topic: 4208 Message: 4208

I saw a posting about a new painted and Silk screened case for about $40.00 dollars.
Who is the contact person for this (Doug?).
As the decals on mine really stink, second time to install them, I thought about putting a top coat of a clear lacquer on them but I though it might may then curl up.

Please advise.

Thank you,
Danny

Ive had good success with a waterbased polyurethane topcoat over waterslide decals. More durable than laquer. Acrylic enamels (as in automotive) will be very durable as well. try an autoparts store and don't buy any spray can that has dust on it!! (There's OLD stuff in that can!)

I've got a request into Mrs. Claus for a DC2 paddle from American Morse. Henderson no longer makes the integrated paddle (they never explained why they stopped production), so I looked around for a lightweight, rugged backcountry option. http://www.americanmorse.com/dcp.htm

I have not received it yet, never used it of course, and I don't even know the code yet so I can't give a review.

Erg. Hendricks, not Henderson. I'd use age as an excuse but I'm still too young... ;)

Doc - K0EVZ has a PFR3 for sale. This will work when you get it, because I will guarantee it to work at least as well, and this one works better than published.. This is the famous YELLOW RADIO!It is has just been checked over by Steve Weber!Doc will sell this radio to you for $265 shipped to your continental US house. You can chase dx, chase fox, and simply have a whole lot of fun.Just in time for Christmas, get this one for that special radio nut this year! First check or money order will get a great radio.
Have a great day,

Yah I've heard of these keys Bob. Thanks for sharing - they are works of art! It's nice to see there's still craftsmanship and artisan quality in the world these days. I'm not sure I could get into a Begali for $45, but it's something to look for in my future.

My wife and I hope to honeymoon in Italy sometime soon (we married 6 mos ago, but with 3 kids in college, one serving an LDS mission and two about to graduate we don't see how we can afford it right now). I wonder if she'd let us visit the Begali shop while we're there. LOL...

Thanks again, Bob. All the best,

John O.

Hi John,
I have a set of paddles like you plan on getting but mine do not have that solid part over top of both paddles.
My paddle levers slide down on steel pint then on top is a flat washer and a ceri clip.
Yes the keys in the U tube are nice but way to much for me.
Anyway after more then 30 years I gave up ham radio and went back to playing guitar and song writing.
I'm starting to build up a recording studio in this small apartment.
I made my first big hit last week and a friend plastered this on my face book.
BOB AF2Q

Hi,I went out with Bob last night to a place in NJ South of here about 40 miles.
There were other guitar players But Bob was not worried since he spent just about all of three weeks writing,playing and changing finger patterns on his guitar.
He sang five songs then he said he had one more and it was a song that he wrote about the loss of Diane.
He started then in less then thirty seconds the entire place went silent except for Bob singing.More then half way into his song,almost every man and Woman was in tears.
One gentleman went up and said that in 43 years of guitar playing,he has never heard any player play an acoustic guitar like Bob.
Between the cords and the three different finger picking patterns he spent hours getting them perfect it sounded as if he was playing two guitars at one time.
I love you Bobby but it's now time to let go.
With all my love,your littler sisters Donna and Sissy

Another paddle to consider is the te ne ke. Our club makes and selis this rugged little paddle for just $40.
I currently have 6 in stock. There is also a nice chrome base available that was made by the inventor of the te ne ke, Boyd mason.

Hi Matt,

Your assumption is correct, the two parts are NOT equivalent. The 5817 is a 1 Amp. 20 Volt Schottky rectifier and the 5711 is a 15mA 70 Volt Schottky small signal diode.

The 5711 won't handle the current flowing through it with the PFR in transmit (approx. .75 Amp's.)

Best of luck with the project and

Matt,

Well, I misread your message so the answer to your question is "no", it -is- a problem. Also, at 15 mA maximum rating, the 5711 might not stand up even to the current being pulled through it with the PFR in receive (34 mA "idle", 47 mA "active"). The rest of the stuff I said stands.

The function of that part, BTW, is reverse-polarity protection.

Steve and Bob,

Thanks for the info. I did a "smoke test" last night with no issues but I think that I will contact hendricks or run down to the local store and get the correct one. I think that once I transmit, like Steve said, I will have an issue.

Bob, I noticed that when you listed the parts on your original email that you listed the same diode twice. Just wondering if this was meant to be?

Thanks again for the quick responses and I will make sure and get it all figured out before transmit.

Again, always learning and this was a great opportunity.

Thanks!

Matt

From: <mtrager1@...>
Topic: 4244 Message: 4244

Greetings to all,

I will be building the PFR3a soon and was wondering if anyone has extra printed circuit boards (for sale) for the Touch Paddles (manufactured by ExpressPCB)? I see that to buy a set costs about $75 dollars or so. If anyone has one to sell or needs one please email me and we can split the costs.....

Thank you,

73's Michael
http://n2zdb.com/n2zdb http://n2zdb.com/n2zdb

I see what you have there. That's kind of steep. If you can layout the board in Eagle or have standard Gerber CAM files, submit it to OSHPark. You should be able to get three boards for about $15 shipped with about a two week turn around. I'm very satisfied with what they've produced for me. More info at their website (downloadable design rules, pricing, etc.). Why so cheap? Among other reasons, they combine small designs to get up to the standard panel size before fabrication and only then produce them.

Paul - K9MR

4249. Tuner Problem - BLT Tuner

Yahoo group: pfr3_group
Date: 2013-12-23 16:18:11 UTC
From: <wd4msm@...>
Topic: 4249 Message: 4249

I am a new (very new) PFR user and am having a BLT tuner problem:

The setup is:

Coax fed G5RV antenna to the BNC plug.

Setting up S7, S8, and S9 and the "coax switch" on the rear of the radio I am unable to get any dimming of the LED. Adjusting the "tune" and "load" in any manner does not dim the LED one whit.

Obviously I am missing something! :-)

Could I get a suggestion from the group?

Thanks

From: Steven Weber
Topic: 4249 Message: 4250

Does your G5RV have the ladder line matching section or do you connect the coax directly to the wire? If you are not using the ladder line section, it may not be possible to match to that antenna.

Back when I used the "short" G5RV and ran it on 40, I found I had to adjust the length of the coax feed section in order to be able to match to it. On 20, the band which the antenna is actually designed to work on, no problem. Don't even think about using it on 30.

You might try matching a 50 ohm dummy load just for practice and to prove you have everything set up properly. Learning to use the BLT takes some practice.

Steve KD1JV

Thanks Steve.

I can't connect directly to the ladder line but I can try a dummy load to see that all is well with the PFR. The internal tuner in the Icom 703 seems to have no trouble with the antenna. I still believe I must have some setting on the PFR set incorrectly.

Barry,

I fully checked out the tuner and it worked perfectly. Set the back panel toggle switch toward the Bal Line posts. Make sure the slide switches are fully to the left or right as desired. Tune/Oper to Tune. Coax/Blt to Coax. Low Z/Hi Z to Hi Z (This one is guess work to see whether Hi or Lo works the best). Set the Tune control to mid-range and adjust the Load control for a dip in the LED. If you get no dip, set the Load control to mid-range and adjust the Tune control for a dip. Go back and forth until the LED goes out completely. Occasionally you will have to back off one or the other to find the perfect spots.

The back panel toggle switch seems to work in both positions on both your Puffer and mine. The radio will tune up in either position. I usually find that a get a bit more output in the Bal. Line position.

Keith

Subject: [pfr3_group] Tuner Problem - BLT Tuner

I am a new (very new) PFR user and am having a BLT tuner problem:

The setup is:

     Coax fed G5RV antenna to the BNC plug.

Setting up S7, S8, and S9 and the "coax switch" on the rear of the radio I am unable to get any dimming of the LED. Adjusting the "tune" and "load" in any manner does not dim the LED one whit.

Obviously I am missing something!   :-)

Could I get a suggestion from the group?

Thanks

Keith,

It worked! The "counterintuitive" switch toward the balanced line posts did it!

Thanks,

Barry. WD4MSM

4254. L2 and L3 -- replacements

Yahoo group: pfr3_group

From: John Overbaugh
Topic: 4254 Message: 4254

Well... I've had my PFR kit for 3 years now. I finished group 1 today and passed the smoke test. Group 2 is going great, but I seem to have misplaced L3 (the 10 uHy choke). I inventoried the parts when I got the kit way back, and everything was there, so this is just a situation where time allowed one to escape!

Any recommendations on an online source? I have a local shop that sells a fairly good range of components, but I think a choke is a long shot...

Excited to finally be building this up. With a bit more soldering, and forty-leven toroids ahead of me, I hope to finish before the new year. 2014 is the year I learn CW!

4255. Using the PFR-3a

Yahoo group: pfr3_group
Date: 2013-12-24 05:34:56 UTC
From: <mtrager1@...>
Topic: 4255 Message: 4255

I just completed a PFR-3a for an amateur who could not get it to work. The main problem was that none of the toroids enamel was removed before soldering!:(

It is now working but I noticed that I could not get a null from the LED when in TUNE mode with the rear toggle switch towards the BNC jack. However if the rear switch is towards the BLT connectors I do see a NULL on the LED when turning the "TUNE" knob. The load does not seem to make any difference when rotated! Does anyone know why?

Here are some pictures from today...

http://n2zdb.com/PFR3a/one.jpg http://n2zdb.com/PFR3a/one.jpg
http://n2zdb.com/PFR3a/two.jpg http://n2zdb.com/PFR3a/two.jpg
http://n2zdb.com/PFR3a/three.jpg http://n2zdb.com/PFR3a/three.jpg

The purpose of L3 is to ensure RF doesn't get back into the audio amp via pickup on the headphone cord. In most cases, it probably isn't needed at all. You can either sub a small value resistor (5.6 or 10 ohms) or just use a jumper instead. The value of the inductor here isn't critical, although going larger in value would be better then going smaller. So, if you can find something in the "ball park" that would be fine too.

Thanks Steve, I was wondering what that was for. A friendly member of the group has a spare and is sending me one. Meanwhile maybe I'll sub in a 10 ohm resistor for now so the project can keep going.

This is one thing I love about radio -- everyone's willing to help! I may actually get this thing on the air by the new year...

Hi Michael,

Generally they are semicircular plates. If the plates are meshed fully (overlap completely) you will be at maximum capacitance on the trim.

Hope this helps.

Hi Marq, And a Happy and Better New Year to you and yours too.
Congratulations for the finish of the 2nd PFR3. The main difference, when comparing one to the other.. given that all the switches and connections are exactly identical, would be the winding of the large toroid, and its spacing of turns. One quick check of the trimmers on the tuning caps would be in order too. Another common failure in this area is the tinning of the toroids wires...
Good Luck,

Have a great day,

Marq,

Make sure that the switch at the rear is toward the wire posts, not the BNC connector. I built my PFR-3A 2 1/2 years ago and have many many Q-s on it. This morning I changed bands and spent 15 minutes trying to adjust the BLT to get the light to go out. No luck. Thought something must have failed. Then I saw the switch set toward the BNC connector. Flipped it to the posts and she tuned up normally. With my PFR-3A I have to have the switch set toward the posts always when using the internal tuner. This is true whether I am using a long wire and ground connected to the posts or coax to the BNC connector. Love this little rig.

Hi Marq, If the winding went bad on the toroid... (bad solder connection) it would be bad on (BLT) too.IF the switch is good... prove it with an ohmeter... I have seen the switch go bad... the other thing that seems so off hand.. but it happens... is that the switch is in the wrong position... IF it is wired like the manual... then it should "point" to the connection the antenna needs to be connected to. a reheat of the t4 connections might be worth the effort too.
The slide switch selecting coax or blt.. is still good too? (ohmmeter)
Have a great day,

> not want to solder to both sides.

The board DOES have plated through holes. Of course, it is possible to get a defective board where some of the holes might not have plated through or it can be damaged like trying to melt through the insulation while the wire is in the hole. The amount of heat need to do that could damage the plating.

For such a simple thing, a lot of people do seem to have trouble with the BLT.

One is getting all the switches in the right position.
Two is just learning how to use it, as it is very touchy with inter-active controls. Just the nature of the beast.
Three is soldering issues with the wire. You really must tin the wires before you put them in the holes and make sure you don't pull the wire past the tinning when you do put the wire in the holes.

Hi Steve,
All the best for 2014
Thanks for your message.
Well as per my previous message this is my 2nd PFR3 , definitely was my best KIT already mounted.
But sometimes we forgot small things ...
After read some ideas ..i still confused.
I can Tune very easy the BLT redusing SWR dim led cpmpletely.
With unbalanced line (COAX) I can't tune , The LED is NOT BRIGHT but seems NO TUNING.
The Swicth it's OK! I've checked with Multimeter
But do you think it's possible on this SWITCH as good electric conection BUT without sufficient
pressure to RF?
Thanks for reading and possible comment

Marq,

When using the BLT with the coax connector, the switch on the back must be set to connect the BNC jack to the binding posts. That I belive you have correct.

On the top of the case you must have the slide switch set to BLT, not COAX. That might be your error. If you have it set to coax, the transmitter is connected to the BNC jack, not the BLT. If the rear panel switch is set to connect to the binding posts, then you are sending power backwards into the BLT coil.

It probably would have been less confusing if we didn't have the switch to connect the BNC jack to the binding posts, but made you use an adaptor if you wanted to connect coax to the BLT output.

Hope your figure it out, there just isn't take much to go wrong other then getting the switches set up properly.

Hello Marq,

From what you describe, since the LED does dim somewhat, that would indicate your load connected to the BNC connector is beyond the matching range of the BLT. The BLT cannot transform all loads to 50 Ohms.

The dimming also indicates that it is matching as well as it is going to get.. leave it there.. if all the switches are in the proper positions, then accept thatas Steve Smith says... it's as good as it gets for that antenna.. either change the feedline length or the antenna length or height to improve the dimming additionally. \ One other thought.. is the trimmer caps on the two polycaps. Adjust them, to the opposite setting, only if the cap is maxed one way or the other. IF the dimminng is mid-range don't bother.
Good Luck,

Have a great day,

Not enough information to make a diagnosis.

The problem could be something as simple as a loose shaft extension collar on the polyvaricon capacitor or it could be caused by an electrical issue.

Does the "RX Peak" control have any affect on signal level when it is turned or does the received level stay the same throughout its rotation?

From: Dale Putnam
Topic: 4284 Message: 4285

If you shut the PFR3 off, remove the paddle, plug in the sk, then hold the key closed, turn the PFR3 on.. it should be back in SK mode. In the menu, the "b" means it is in iambic b mode, (for a paddle). In the paddle mode, tune should still be available through the menu button,held as it steps through the steos. Menu – how long it is held determines function – send msg, keyer speed, tune, enter msg, select iambic a or b. When in
STRAIGHT KEY mode, no menu, but sending msg 1 is still available.

Have a great day,

Straight key mode is enabled when the DASH input is grounded as you turn power on. This can be done by using a mono plug which will automatically ground the dash input or by holding the dash paddle closed as you turn the rig on. What could be more simple?

Dale and Steve thanks for you input. What i have now is in the b. or 6 mode and thats all that appears on the display i can key with the straight key but when i change freq its lost. With the palm paddle in i get fast dits but the dah side of the paddle doesnt work. Is there a way to clear whatever may be in memory ? Dont know how i messed this up. I sure love the radio and have been working all over on 30m of late with it with good reports. Tnx Bill

Turning off the power with out the dash input grounded should put it back into paddle mode. But since you get dits but not dashs, either something is wrong with the paddle or cable or you somehow blew out the port input for the dash and will have to get a replacement processor.

4292. Securing Torroids

Yahoo group: pfr3_group
Date: 2014-01-16 15:14:24 UTC
From: John Overbaugh
Topic: 4292 Message: 4292

Seems like a couple of threads recently regarding torroids which have disconnect, presumable due to the shaking and jarring that happen when one hikes... Since I'm still in the middle of phase 2 of my build out (I'm actually winding torroids currently), I started wondering if there was a way to prevent the breakage of torroid wires.

So here's my question: would there be *any* negative impact from hot gluing torroids to the circuit board? I'm assuming no, seems like hot glue wouldn't be conductive but then maybe it would have some other effect?

Anyhow, if a little glue means I don't have to invent a solder iron from pine pitch, sticks, and flint while in the backcountry, it seems a worthwhile investment!

Thanks and 73's de K7JTO

Yahoo group: pfr3_group
Date: 2014-01-16 15:49:30 UTC
From: Dale Putnam
Topic: 4292 Message: 4293

I believe the reason for the toroids breaking loose, may be from their ability to "slap" or wiggle. I've had only one get loose, and that was causedby the post office tossing the box. (toss was observed). The problem with using any glue, is that it is difficult to make adjustments for fine tuning, and the possibility to change tuning. The addition of candle wax might be considered, to firm the toroid in place, however, the leads themselves should hold it firmly in place, not above the board.

4294. Winding Torroids

Yahoo group: pfr3_group
Date: 2014-01-17 00:15:07 UTC
From: John Overbaugh
Topic: 4294 Message: 4294

I'm winding T1. I can barely fit 40 turns in the torroid, let alone the remaining 5 turns for the primary winding. Is it acceptable to overlap turns? If so, should I overlap turns in the secondary and leave space for the primary, or should I overlap the primary on top of the secondary?

Thanks - I only want to do this once. I believe there's a reason the word "torroids" so closely resembles a medical condition... ;)

John, I have wound many, many toroids. I would overlap the primary on top of the secondary winding and space the primary turns evenly on top of the secondary. In other words, don't closely space the primary on a small portion of the secondary winding.

Hi John,
The pfr3 is a super QRP RIG.
Dale built mine and sent it out for me to try.
I got lost being excited:-) and tuning was a bit rough because of a past stroke I have little feeling in my right hand.
I donated the rig to a friend in the UK who is at war with cancer and I know he always wanted one.
Don't think i'll get another unless I find a builder.
Mom is still needing care in the Nursing home and I was to,close to being placed in that box last SEPT
You'll love the yellow rig.
Puts out more power then any other QRP rig on CW
GL

BOB AF2Q
I'm still doing SAR,and now playing guitars and wring songs

Thanks Bob! By the way, it was awful nice of you to give up your rig to a friend. If you ever want another, I'll volunteer to build it--but let's wait to see how my build turns out first. ;) I'm pretty confident that, between me learning from my mistakes, and my Elmer (who IS a competent electrical engineer) we could build up something quite clean.

From: <boblusby@...>
Topic: 4301 Message: 4301

Bought two PFR-3s at Dayton last year and still have one un-built. They were missing the hook-up wire and stand-off spacers for the caps. I found some stand-offs spacers that work and have some hook-up wire but may not be the Teflon coated type. I tried numerous times to get replacements from Hendricks to no avail. This one has the marked case not the model stick-ons. Anyway, will sell the kit for $225 shipped.

4307. Half voltage on U8 Pins 1 and 13

Yahoo group: pfr3_group
Date: 2014-01-31 23:52:53 UTC
From: John Overbaugh
Topic: 4307 Message: 4307

I'm performing the pretest in group 3. When I power up in straight key mode, I see the correct voltage on pins 1 and 13 on U8 (0 v). When I close the dot key (straight key), the voltage goes up to 1.2v whereas the manual says it should be 2.0 v.

I have reviewed every component and everything appears correct (I did find a missing cap and resistor, not sure how that happened), but still the tests show half the voltage. Anything logical I could be looking for that would explain the lower voltage?

Thanks!

From: <john.overbaugh@...>
Topic: 4307 Message: 4308

Update: moving into group 2, I may have found my mistake.
* Manual R6 & R7 should be YEL/VOL/YEL
* Errata: ORG/ORG/YEL
* Installed: YEL/VOL/YEL

But note: the errata indicates the manual states RED/RED/ORG, but (as you can see above) it does not. I assume the errata takes precedence, in spite of the manual not matching what the errata says? This should be ORG/ORG/YEL?

There appear to be absolutely no ORG/ORG/YEL resisters in my kit. However, when I look up 470k I see YEL/VOL/YEL as the correct colors.

Any suggestions?

Hi John,

Since what you are 'looking' at is a square wave at HF frequencies, it could be as simple as your DVM not being able to correctly average the reading. I'd recommend moving forward.

Best of luck with the rest of the build and

Subject: [pfr3_group] RE: Half voltage on U8 Pins 1 and 13

Update: moving into group 2, I may have found my mistake.
* Manual R6 & R7 should be YEL/VOL/YEL
* Errata: ORG/ORG/YEL
* Installed: YEL/VOL/YEL

But note: the errata indicates the manual states RED/RED/ORG, but (as you can see above) it does not. I assume the errata takes precedence, in spite of the manual not matching what the errata says? This should be ORG/ORG/YEL?
There appear to be absolutely no ORG/ORG/YEL resisters in my kit. However, when I look up 470k I see YEL/VOL/YEL as the correct colors.
Any suggestions?

As Steve said, I'd suspect that the voltage seen there, is more important to see it change when keyed, rather than be concerned about the exact level. Returning to Zero after keyed, is a good thing too.

Have a great day,

Subject: [pfr3_group] Half voltage on U8 Pins 1 and 13

I'm performing the pretest in group 3. When I power up in straight key mode, I see the correct voltage on pins 1 and 13 on U8 (0 v). When I close the dot key (straight key), the voltage goes up to 1.2v whereas the manual says it should be 2.0 v.

I have reviewed every component and everything appears correct (I did find a missing cap and resistor, not sure how that happened), but still the tests show half the voltage. Anything logical I could be looking for that would explain the lower voltage?

Thanks!

John O.

Hi John,

The latest revision of the PFR-3A manual shows R6 & R7 as 470K on the schematic and in the parts list. If you have 470K in both locations, leave them.

Improper parts there would not affect operation of U8 as they're in the RX audio filter.

Have fun!

Thank you all again for the quick answers. Moving on to l7 and the tuner next. I see light at the end of the tunnel (which is good--I find my vision is rapidly falling apart, had to use a flashlight yesterday to read component lettering!).

4314. PFR3 IC "migration"

Yahoo group: pfr3_group
Date: 2014-02-10 02:29:13 UTC
From: John Parnell
Topic: 4314 Message: 4314

Hi All, I emerge from lurking to note a workbench (re) discovery:

I noted - to my bitter disappointment - that my trusty PFR3 would not RX/TX and that the display was going crazy. it was odd since I had not been using it for a few weeks and it worked OK the previous time. I despaired since troubleshooting is not my strong suit. I pulled the board out of the rig and and gave it a careful once-over; all looked ok. then, while seeing all those IC's, I recalled what a techie friend suggested to me many years ago: try pressing the IC's firmly to make sure they are seated - sometimes the ambient heating and cooling can cause ICs to "wiggle" out a bit - resulting in a weak (or open) contact.

I went through the board and GENTLY pressed each of the IC's into their socket and noted each moved in a bit when pressed. I then applied power, antenna, speaker and key and - voila! - everything was FB again . good RX and full output. Worthy of sharing, I thought, this might save some other poor soul some grief.

4315. No receive

Yahoo group: pfr3_group
Date: 2014-02-14 22:22:16 UTC
From: John Overbaugh
Topic: 4315 Message: 4315

Erg. OK folks, returning to the group for a little help. Way back when I finished group 2, I smoke tested it. I attached a long wire to the left side of R1 to see if I hear signal and, well, heard nothing. I thought nothing of it however, as I was in my buddy's basement surrounded by a wall of (running) servers.

I'm just about done with the entire kit (I have only that monster torroid left to wind), and today I got a break at work so I checked on 20m with my 817 and found a frequency with CW. When I tuned the PFR to that freq and touched the long wire to R1, I still got nothing.

Any recommendations on where to start troubleshooting this? In troubleshooting other issues, I've gone through the entire build process, twice, checking for installation of the wrong components, etc. Everything has checked out correct. Remembering recent conversations, I pulled each of the chips out and reseated them, but still no joy.

I'm getting a "guy's night out" tomorrow and will spend the evening wrapping up the build, but of course no receive is really not a good thing in "two-way" radio. I'd love to finish up tomorrow and have a fully-functional PFR3 on my hands but I'm a bit disturbed by this development.

Thanks in advance,

John O.

Hello John,

You don't say if the transmitter is functioning properly and I'm not going to assume anything. If it is, that is more than half the battle won.

Have you tried following the troubleshooting steps (pg. 22 if your rig is a 3A; pg. 20 if your rig is a 3)?

HI John, The biggest problem with the rx of the PFR3, is the soldering.. especially on T1 and L1... you can use an ohmeter on R1 to see if half of T1 is soldered in.... then on both ends of L1.. should also read zero ohms to ground. IF that checks.. then the only other concern is the other half of the problems that stubbornly remain at this point.. and that is the proper installation of T1... The input side (R1) is the least number of turns.... it is a step up xtmr... Use some real good glass and make sure that is proper. You might try the "finger touch/listen" on arm of V1, see if that gets hum... if it does.. then check the correct insertion of the ics (I figure you have before you started... by looking at the board) once in a great while, a component may fail, if static is rampant in your build area, then one of the ICs may have left the building.

Have a great day,

Bingo - I had another unexpected shot of free time and so I wired everything back up. Still completely silent except when I touched L1 and/or T1 with my fingers. Plenty of dits and dahs. If you recall, I had that ridiculous idea of strengthening the mounting of my torroids with candle wax? Yah... so... it's going to be a bit of a mess, but I will clean everything up, desolder it all, check the wires, and resolder L1 and T1. Anecdotally from R1 to L1 both contacts go to 0 ohms. To T1 3 of 4 contacts consistently go to 0 and one of them seems like a cold join. I might start by just reheating that joint (it's the easy things, right).

Just curious, what am I doing when I touch L1 with my fingers? My body appears to be an antenna, so maybe my issue is I just wasn't hooking the antenna to the correct spot when I tested?

Hi John, Your finger was the antenna.. and yes you were using the correct spot on R1.. if it was not the grounded end. The cold solder joint seems very very likely... or maybe the lead wasn't quite as clean....the wax is the best thing.. just think.. to reheat with hot glue or something else.. woulda made you run for fresh air..as it is.. with wax... it will just be slightly messy... I use Party Light candles.. so it smells good. Good Luck, you're on the right path,

Have a great day,

OK so when I touch a wire to the right side of L1 from the top of the board (side closest to C4) I hear dits and dahs loud as day. Touch the other side of L1? Nothing. Touch the wire to R1 on either side, nothing as well. Seems curious, but I haven't taken much time to look at the schematics (other than to see T1 and R1 are both on the opposite side from C79, which is interesting).

Given it's Valentine's day, my window to work has closed but I'm set and optimistic about wrapping this up tomorrow. If anyone has insights, I'm all ears (eyes?) and thanks, again, for all the help. Sheesh... I will be quite glad to have this behind me.

4323. RE: [pfr3_group] No receive

Yahoo group: pfr3_group
Date: 2014-02-15 01:13:15 UTC
From: Dale Putnam
Topic: 4315 Message: 4323

Hi John, Take T1 out.. insure that it is being put in correctly, with tinned leads. With it rx on L1.. the rest of the circuit is close to being right.T1 and right in that area is where the issue is.

Have a great day,

--... ...--
Dale - WC7S in Wy

Subject: Re: [pfr3_group] No receive

OK so when I touch a wire to the right side of L1 from the top of the board (side closest to C4) I hear dits and dahs loud as day. Touch the other side of L1? Nothing. Touch the wire to R1 on either side, nothing as well. Seems curious, but I haven't taken much time to look at the schematics (other than to see T1 and R1 are both on the opposite side from C79, which is interesting).

Given it's Valentine's day, my window to work has closed but I'm set and optimistic about wrapping this up tomorrow. If anyone has insights, I'm all ears (eyes?) and thanks, again, for all the help. Sheesh... I will be quite glad to have this behind me.

On Fri, Feb 14, 2014 at 5:49 PM, Dale Putnam <daleputnam@...> wrote:

Hi John, Your finger was the antenna.. and yes you were using the correct spot on R1.. if it was not the grounded end. The cold solder joint seems very very likely... or maybe the lead wasn't quite as clean....
the wax is the best thing.. just think.. to reheat with hot glue or something else.. woulda made you run for fresh air..as it is.. with wax... it will just be slightly messy... I use Party Light candles.. so it smells good.
Good Luck, you're on the right path,

Have a great day,

Subject: Re: [pfr3_group] No receive

Bingo - I had another unexpected shot of free time and so I wired everything back up. Still completely silent except when I touched L1 and/or T1 with my fingers. Plenty of dits and dahs. If you recall, I had that ridiculous idea of strengthening the mounting of my

torroids with candle wax? Yah... so... it's going to be a bit of a mess, but I will clean everything up, desolder it all, check the wires, and resolder L1 and T1. Anecdotally from R1 to L1 both contacts go to 0 ohms. To T1 3 of 4 contacts consistently go to 0 and one of them seems like a cold join. I might start by just reheating that joint (it's the easy things, right).

Just curious, what am I doing when I touch L1 with my fingers? My body appears to be an antenna, so maybe my issue is I just wasn't hooking the antenna to the correct spot when I tested?

On Fri, Feb 14, 2014 at 4:51 PM, Dale Putnam <daleputnam@hotmail.com> wrote:

HI John, The biggest problem with the rx of the PFR3, is the soldering.. especially on T1 and L1... you can use an ohmeter on R1 to see if half of T1 is soldered in.... then on both ends of L1.. should also read zero ohms to ground. IF that checks.. then the only other concern is the other half of the problems that stubbornly remain at this point.. and that is the proper installation of T1... The input side (R1) is the least number of turns.... it is a step up xtmr... Use some real good glass and make sure that is proper. You might try the "finger touch/listen" on arm of V1, see if that gets hum... if it does.. then check the correct insertion of the ics (I figure you have before you started... by looking at the board) once in a great while, a component may fail, if static is rampant in your build area, then one of the ICs may have left the building.

Have a great day,

Subject: [pfr3_group] No receive

Erg. OK folks, returning to the group for a little help. Way back when I finished group 2, I smoke tested it. I attached a long wire to the left side of R1 to see if I hear signal and, well, heard nothing. I thought nothing of it however, as I was in my buddy's basement surrounded by a wall of (running) servers.

I'm just about done with the entire kit (I have only that monster torroid left to wind), and today I got a break at work so I checked on 20m with my 817 and found a frequency with CW. When I tuned the PFR to that freq and touched the long wire to R1, I still got nothing.

Any recommendations on where to start troubleshooting this? In troubleshooting other issues, I've gone through the entire build process, twice, checking for installation of the wrong components, etc. Everything has checked out correct. Remembering recent conversations, I pulled each of the chips out and reseated them, but still no joy.

I'm getting a "guy's night out" tomorrow and will spend the evening wrapping up the build, but of course no receive is really not a good thing in "two-way" radio. I'd love to finish up tomorrow and have a fully-functional PFR3 on my hands but I'm a bit disturbed by this development.

Thanks in advance,

John O.

From: John Overbaugh
Topic: 4315 Message: 4324

Success! Removed L1 and T1, resoldered, and realized RX peak was at minimum. I'm happily hearing dits and dahs.

Kitted the box and had issues with the batt packs melting before the leads could tin. That was frustrating!

With my simple Elecraft T1 tuner's 1, 5, or 10 w meter, I'm seeing 5 watts output on 30 and 40, and something 1 < > 5 on 20. I have an ouiput meter here at home, so I'll get accurate readings soon.

Decals, clear coat, and getting familiar with the radio next!

Thank you, again, to the group for the help so far. I'd never have gotten to this point without it! No more building for a while, looking forward to operating now.

Hah--that was my first comment to my buddy Chuck last night--now I need to QSO with Dale WC7S in Wyoming.

We have a tassle of kids home for the "holiday" weekend. Depending on my schedule I am hoping to operate over lunch hour Wed. Probably too soon, I'm sure all I'll copy is call sign, rig, pwr, and wx but hey, its a start!

I work form home which is why I can occasionally operate lunchtime. Otherwise what's a good time of day for you?

Subject: RE: [pfr3_group] No receive

Hah--that was my first comment to my buddy Chuck last night--now I need to QSO with Dale WC7S in Wyoming.
We have a tassle of kids home for the "holiday" weekend. Depending on my schedule I am hoping to operate over lunch hour Wed. Probably too soon, I'm sure all I'll copy is call sign, rig, pwr, and wx but hey, its a start!

I work form home which is why I can occasionally operate lunchtime. Otherwise what's a good time of day for you?
On Feb 16, 2014 9:38 AM, "Dale Putnam" <daleputnam@...> wrote:

Congratulations!! Now we can have a 3-2-3 Q... (PFR3 - 2 - PFR3 Q)...having fun is what it is all about now!!

Have a great day,

Subject: RE: [pfr3_group] No receive

Success! Removed L1 and T1, resoldered, and realized RX peak was at minimum. I'm happily hearing dits and dahs.
Kitted the box and had issues with the batt packs melting before the leads could tin. That was frustrating!
With my simple Elecraft T1 tuner's 1, 5, or 10 w meter, I'm seeing 5 watts output on 30 and 40, and something 1 < > 5 on 20. I have an ouiput meter here at home, so I'll get accurate readings soon.

Decals, clear coat, and getting familiar with the radio next!
Thank you, again, to the group for the help so far. I'd never have gotten to this point without it! No more building for a while, looking forward to operating now.
On Feb 14, 2014 6:13 PM, "Dale Putnam" <daleputnam@...> wrote:

Hi John, Take T1 out.. insure that it is being put in correctly, with tinned leads. With it rx on L1.. the rest of the circuit is close to being right.T1 and right in that area is where the issue is.

Have a great day,

Subject: Re: [pfr3_group] No receive

OK so when I touch a wire to the right side of L1 from the top of the board (side closest to C4) I hear dits and dahs loud as day. Touch the other side of L1? Nothing. Touch the wire to R1 on either side, nothing as well. Seems curious, but I haven't taken much time to look at the schematics (other than to see T1 and R1 are both on the opposite side from C79, which is interesting).

Given it's Valentine's day, my window to work has closed but I'm set and optimistic about wrapping this up tomorrow. If anyone has insights, I'm all ears (eyes?) and thanks, again, for all the help. Sheesh... I will be quite glad to have this behind me.

On Fri, Feb 14, 2014 at 5:49 PM, Dale Putnam <daleputnam@...> wrote:

Hi John, Your finger was the antenna.. and yes you were using the correct spot on R1.. if it was not the grounded end. The cold solder joint seems very very likely... or maybe the lead wasn't quite as clean....

the wax is the best thing.. just think.. to reheat with hot glue or something else.. woulda made you run for fresh air..as it is.. with wax... it will just be slightly messy... I use Party Light candles.. so it smells good.

Good Luck, you're on the right path,

Have a great day,

Subject: Re: [pfr3_group] No receive

Bingo - I had another unexpected shot of free time and so I wired everything back up. Still completely silent except when I touched L1 and/or T1 with my fingers. Plenty of dits and dahs. If you recall, I had that ridiculous idea of strengthening the mounting of my torroids with candle wax? Yah... so... it's going to be a bit of a mess, but I will clean everything up, desolder it all, check the wires, and resolder L1 and T1. Anecdotally from R1 to L1 both contacts go to 0 ohms. To T1 3 of 4 contacts consistently go to 0 and one of them seems like a cold join. I might start by just reheating that joint (it's the easy

things, right).

Just curious, what am I doing when I touch L1 with my fingers? My body appears to be an antenna, so maybe my issue is I just wasn't hooking the antenna to the correct spot when I tested?

On Fri, Feb 14, 2014 at 4:51 PM, Dale Putnam <daleputnam@...> wrote:

HI John, The biggest problem with the rx of the PFR3, is the soldering.. especially on T1 and L1... you can use an ohmeter on R1 to see if half of T1 is soldered in.... then on both ends of L1.. should also read zero ohms to ground. IF that checks.. then the only other concern is the other half of the problems that stubbornly remain at this point.. and that is the proper installation of T1... The input side (R1) is the least number of turns.... it is a step up xtmr... Use some real good glass and make sure that is proper. You might try the "finger touch/listen" on arm of V1, see if that gets hum... if it does.. then check the correct insertion of the ics (I figure you have before you started... by looking at the board) once in a great while, a component may fail, if static is rampant in your build area, then one of the ICs may have left the building.

Have a great day,

Subject: [pfr3_group] No receive

Erg. OK folks, returning to the group for a little help. Way back when I finished group 2, I smoke tested it. I attached a long wire to the left side of R1 to see if I hear signal and, well, heard nothing. I thought nothing of it however, as I was in my buddy's basement surrounded by a wall of (running) servers.

I'm just about done with the entire kit (I have only that monster torroid left to wind), and today I got a break at work so I checked on 20m with my 817 and found a frequency with CW. When I tuned the PFR to that freq and touched the long wire to R1, I still got nothing.

Any recommendations on where to start troubleshooting this? In troubleshooting other issues, I've gone through the entire build process, twice, checking for installation of the wrong components, etc. Everything has checked out correct. Remembering recent conversations, I pulled each of the chips out and reseated them, but still no joy.

I'm getting a "guy's night out" tomorrow and will spend the evening wrapping up the build, but of course no receive is really not a good thing in "two-way" radio. I'd love to finish up tomorrow and have a fully-functional PFR3 on my hands but I'm a bit disturbed by this development.

Thanks in advance,

John O.

4329. Touch Paddle PCB and Parts....

Yahoo group: pfr3_group
Date: 2014-02-21 03:16:30 UTC
From: <mtrager1@...>
Topic: 4329 Message: 4329

Just ordered 4 printed circuit boards and necessary parts to complete 4 Touch Paddle Kits. I will sell 3 of them once I have the one successfully installed and working properly.

Here are some pictures from the web of what it looks like:

Keith,
I was trying to find a supplier of the kit but could not. I am building the PFR3a for an amateur in Spain and he requested that I install it. Today I received the printed circuit boards and drilled some holes in the bottom panel.

Unfortunately the touch sensor IC had the wrong footprint so I had to re-order that.....
See links to some pictures from today....

Bring that PFR3 or any radio, over to the RMRc net today.. at 4:00pm MT or 2300z, on 14.0625. We have a "net" that operates at YOUR speed... just call in, with your call... and I will match your speed,we have a nice chat.. you listen to all the others check in... and we get to practice cw.. while meeting folks and swapping temps.. recipes, what we're doing in the ham shack, garden, garage... or whatever..No funny Q signals... just plain meetin up and talkin. We take about 5 - 10 minutes per checkin.. so you don't have time to get all flustered. Exchange name and qth.. and say bye.. if you want.It is sponsered by the NAQCC.. but this is the only activity that is allowed to be hi power if you want.Look for you... Have a great day,

Time 2316Z Dale you completely faided out on me . But I did copy most of your last xmition. I did have my HexBeam pointed to you, otherwise I would not have heard you. I called at first running 40 watts, then realized not enough so upped it to all I have, 100. It is almost dark here and temp about 66 deg..
Thanks for answering me.

Hi TBone, right after you checked in... another fellow from that direction checked in and had QSB that took him out too.. almost gone but not quite... Bad qsb that direction.. very deep fade. Thanks for the info.. yes.. this time of day is a real ck on props... but a bit later after savings time.. it gets to be ok..Thanks for the chk in !!Hope to cu again.. I am working on getting my other power supply up so I can run up to 100w too.. maybe next week.

Have a great day,

Time 2316Z Dale you completely faided out on me . But I did copy most of your last xmition. I did have my HexBeam pointed to you, otherwise I would not have heard you. I called at first running 40 watts, then realized not enough so upped it to all I have, 100. It is almost dark here and temp about 66 deg..

Thanks for answering me.

Hi TBone,
  right after you checked in... another fellow from that direction
checked in and had QSB that took him out too.. almost gone but not
quite...
Bad qsb that direction.. very deep fade.
Thanks for the info.. yes.. this time of day is a real ck on props...
but a bit later after savings time.. it gets to be ok..
Thanks for the chk in !!
Hope to cu again..
I am working on getting my other power supply up so I can run up to
100w too.. maybe next week.

Have a great day,

I guess you've been gone for a while. Yahoo made this change a few months ago and many don't like it. It does take some getting used to and in some ways is better and worse in others. It seems they made the changes to make delivering advertising easier for them and more intrusive for us. Oh well, you get what you pay for and someone has to pay for what we get.

Hi,

Without being disrespectful of any body elses' work, If it is helpful, I own server space that can be used by the group for a website - it is US hosted.

The space exists for my clock making business (www.dougswordclocks.com) - It is not going away any time soon (been here for 5 years so far) and I provide similar support to a number of other community groups.

Doug

Tnx for the reply Steve, I guess I'll get used to it someday. HI.
Anyway, took out the PFR3 and hooked it up to my old MP-1 whip antenna here in the house and with one radial on the floor worked first WA7NCL in WA 967 miles away and then W7VVW 921 miles away also in WA, both on 20m, yesterday afternnon, for a nice chat he gave me 569, of course he was using a beam at 60' and that helps. I love this radio!

There's going to be a Fox hunt tonight.. on 3.560 plus of minus 10khz (or kc for the older crowd)starting at 7pm Mt.. or 0100z (for the younger crowd).... there will be two Fox about.. K9XE and TheWily Western Fox... - WC7S in Wy.. The Fox are usually split so one is in the higher half.. and one is in the lower half...AND.. the fox usually calls: FOX WC7S up..... meaning you call him up about 1 - 2 kc higher...and if you listen to that freq.. for the space of one call.. or even one letter you can tell if someone else ison your freq.. if there is someone there.. MOVE a little bit.. not a lot.. just a bit.. and the FOX.. will find you..Call with your callsign, just ONE time... listen.. if the FOX isn't calling you.. move a tiny bit to a clear spot..call him again.. one time... listen.. if he isn't callin you.. or anyone.. move again.. call again.. listen..
This will make it so much faster for everyone.. the key to the whole thing.. is first finding the fox.. second finding a calling spotthird getting heard by the FOX....
And later.. the FOX will be listening on his own freq too.. so you can work him simplex.. that makes it easier..
So.. set up and get ready.. we're going to have a FOX HUNT!!!

Have a great day,

--... ...--
Dale - WC7S in Wy

PFR members,
Just want to let you know Bill G4KKI is now an SK about 4 hours ago.
Both of us waited to make that CW 2 way.
The pfr3 I sent him arrived on the same day he was told he had cancer but i'm happy he had some guy string up a wire and he did work some stations.
He sent me a picture when things looked good then things turned against him.
He was hot on CW and loved QRP.
I will miss him like a Brother.
BOB AF2Q RIP Bill

The Foxtravaganza is being discussed... behind closed bushes... and maybe a tree... or two...The Game Warden and a few other voices are being heard too.... They are all talking about a FoxTravaganza.. that will be happening... are you ready for this????????
NEXT WEEK!! oh yeah!!
Next Week.. whew.. and I can hold off for another week or so.. no problem... after that the Withdrawls will attack.. I know...
Next week.. mark a calander... or maybe a calender.. for either Tues or Thurs... that is the discussion.. one or the other...
Some other notes of interest... all the FOX folks.. altenates too.. will be in either the 40 or the 80 acre woods..and they can be fleet of foot.. and dash willy nilly between the two.. HOWEVER.. there is one thing that will be common among them.. and that is that they will all be using the same name in the exchange. And using the same name will be in honor of AL... who is hunting fox now in the Great Foxhunt,having gone SK this season. Stay tuned for more information, as my ear to the ground.. gets used some more... use. And I relay it on,

Have a great day,

Have a great day,

Hello all. I am very interested in purchasing a PFR3 kit through the qrpkits website. However, I wanted to make sure that the kit is available / in stock before doing so. What's the best way to do that? I am a bit concerned because I did send a message to the email address on the order page a few days ago, but have yet to receive a reply.

Thanks!

4366. Recieve WWV

Yahoo group: pfr3_group
Date: 2014-04-12 21:55:11 UTC
From: <k6mgo@...>
Topic: 4366 Message: 4366

The other day I tried to tune in WWV on my PFR3A and while the digital display showed "000" on the 30m band, I didn't hear WWV or anything, even though I know the frequency of the PFR3A is very close as compared to my K3 and that has been calibrated to WWV.

My question is, is anyone able to tune in WWV on the PFR3A or is it blocked ?

Tnx and 72,

Bill, k6mgo

Topic: 4366 Message: 4367

Actually blocking it from being received would be a hard trick. The narrow fixed xtal filter will make it harder to copy the audio. Try tuning on both sides of 10 mhz. On one side the audio will be upside down like tuning 20m with lsb. But the other side would have the bfo correct to copy something with distortion due to the narrow filter. I havent tried receiving ssb or am with this rig.

As the final event of the 2013-2014 Winter Fox Hunts, the K0FRP Foxtravaganza! will be held Thursday evening, from 0100Z- 0230Z (Friday, UCT). All Foxes, Alternates, and Committee members will operate on 40M or 80M (or both) and all Foxes will report their names as "AL."All Hounds are encouraged to see how many "ALs" they can work. Activity will center on the QRP frequencies (3.560 and 7.040) but will not be restricted to the usual 20KHz, so listen high and low!
See the rest of the Warden's Announcement at qrpfoxhunt.organd let's have a lot of fun honoring AL!!

Have a great day,

From: kleinfelter.groups@...
Topic: 4369 Message: 4369

I just received my PFR-3a kit. I've downloaded the assembly instructions from QRPkits, and I'll update them with the errata from http://www.qrpkits.com/pfr3.html http://www.qrpkits.com/pfr3.html .

I'm adequately skilled with a soldering iron, and I built a working SoftRock.

What advice would you give to a new PFR-3a builder? What are some of the frequently made mistakes when building one?

Building is pretty straight forward. Be sure you remove the varnish from the magnet wire when soldering in the toroidal. Check for continuity. Check the bottom of the board to see that all solder joints are complete.

Kevin

I suggest watching orientation of ICs as anything with 4 or more leads is a pain to unsolder. Some of the transformer windings may require careful attention. of course be careful in identifying any part.

The ATU takes some training but works fine. Enjoy the journey.

Curt

Hi Kevin, Do a complete inventory of the parts... this is a two fold reward, first you get acquainted with the parts, and second.. IF there were to be one missing, it is easier to correct now.Read the manual, twice. and third time on the winding of the toroids. The one that causes the most trouble is the BLT toroid, winding it seems to be a challange for some. The T1 winding is also a point of interest. ALWAYS pretin the toroid leads close to the core, because you will want to snug the toroid up to the board, and pretinning that lead too far away will not help, and leave the leads long until you are for sure and certain that you have the primary and secondary into the proper holes. Always watch the quality of the solder connections.. that causes a number of problems too. This is one of the times when less is great. Balls of solder are a bad thing.
Good Luck, Kevin, It is a great, fun build, and a joy to use.
Have a great day,

4373. Well THAT Didn't Take Long...

Yahoo group: pfr3_group
Date: 2014-05-14 01:30:04 UTC
From: Kevin Kleinfelter
Topic: 4373 Message: 4373

... for me to mess up.

I've wired as far as the Group 1 smoke test. I've got no lights on the LED.

In addition to basic inspection of solder joints and checking that I've not left out any components, I measured some voltages. I'm powering from a 9V battery. I see:
* 9.5 at the battery terminals
* 9.5 volts at D5.
* 8.6 volts on pin 3 of U5, which is marked "+5". That worries me.
* 8.6 volts on pins 1, 7, 20 of U7.
* 8.2 volts on 1-8, 11, 13, 14, 15, 16 of the LED
* 0 volts on pin 9 of the LED

It seems to me like maybe there should be different voltages on some of the pins of the LED.

Suggestions for where to look next? Any way to tell if the ATMEGA is active without the LED?

Sorry for not answering quicker, I've been swamped for at least the past two months! There are little things like that with this kit that turn out to bite you. Most of the kit is very straightforward, but you have to pay very close attention all the time or that one little thing will get you!

Good job with the troubleshooting! I put together a couple blog posts on my build experience, so check out k7jto.blogspot.com if you want to see some photos and read what someone else (who's really inexperienced in building) ran into.

4376. Error in Errata?

Yahoo group: pfr3_group
Date: 2014-05-14 20:47:46 UTC
From: Kevin Kleinfelter
Topic: 4376 Message: 4376

Do the errata apply to current generation kits and instructions? "Current generation" as in received last week, instructions "updated 3/1/10" and board in un-dated/un-versioned.

=== Issue 1 ===
The errata say "There are two caps marked C48... One is between the phone and paddle jack... the cap between the phone and paddle jack should be C30 (.01 UFD)."

The cap between those jacks in marked C49, not C48 on my board, so I'm not sure whether this erratum applies.

C49 is a .001 ufd. The schematic shows C49 and .001 ufd. I installed .001.

>>> Should the cap between the jacks be .001 or .01 ufd?

=== Issue 2 ===
The errata say R6 and R7 color code should be orange orange yellow instead of red red orange. But my instructions say they are Yel/Vol/Yel. R6 and R7 are 470K according to my instructions, so YVY would be correct.

>>> Should R6 and R7 be YVY 470K per instructions or 330K OOY per erratum?

=== Issue 3 ===
Errata say"In the section on the Low Pass Filters it calls for a 33 pfd... This should be a 22 pfd"

I do see a 22 pfd referenced in my instructions, but no reference to a 33 pdf.

>>> What cap are we talking about and which value should it have?

4379. Power Output

Yahoo group: pfr3_group
Date: 2014-05-26 19:59:57 UTC
From: Kevin Kleinfelter
Topic: 4379 Message: 4379

Other than having a weak signal on low output, what harm is there in having higher or lower than 5 watts of output?

It looks like maybe I'm dead on for 40 meters and 10-20% low on 30m and 10-20% high on 20m. I can't tell for certain because the only power meter I've got is the SWR on an old MFJ tuner, and when I use the same meter to measure output of a radio I trust, it does a pretty poor job.

I've counted the turns on my toroids again and again, so I'm confident I've got the right number of turns.

I'm ready to live with the other-than-expected power, unless it means I'll burn out my finals or I'll be spectrally impure.
Kevin / K4KPK

Topic: 4379 Message: 4380

Hi Kevin, It is good that it works... not so good that it doesn't work up to specs. Not so likely to blow the finals, unless... unless the reason for low power out is that either, the tuner isn't tuning correctly causing hi current in the finals... OR the switches aren't in the correct position.. and that is aimed specifically at the antenna selection on the back panel. IF you have a current meter, and can measure the total current, key down, that would aid it being certain as to where the finals are. Over 950 ma... is into the danger zone, with 12 volts input. Does the led for the tuner show a dip? And one last thing.... the radio/tuner needs to be in the "operate" position for normal operation.Good Luck,
Have a great day,

Thank you for the reply. It is in the 'operate' position, straight key mode, key down. Both band switches are in the same position. I'm using the coax connector. (I haven't tried a long wire yet -- just a dummy load. I don't get any dimming of the LED, using the coax, when I switch to 'tune'.)

* On 40m, it draws 0.55 A.
* On 30m, it draws 0.54 A.
* On 20m, it draws 0.95 A. (Right after key down, it hits 1.02, but quickly falls to 0.95)

If I believe my meter:
* 40m puts out 3.5 W.
* 30m puts out 5 W.
* 20m puts out 7.5W.

On the other hand, my meter doesn't agree with the output from my KX3. If I set the output on my KX3 to get the same deflection as the PFR3A, and read the power off the KX3 instead of the meter:
* 40m puts out 5 W.
* 30m puts out 3.4 W.
* 20m puts out 5.1 W.

I'm inclined to believe the power output on my KX3 is accurate, and the MFJ meter is only relatively (not absolutely) accurate. In that case, 40 and 20 look pretty darn good.

The turns on the 30m inductors (L10, L11) are as even as I can possibly make them. Resistance between the ends of the inductors is 0 ohms. A couple of turns on L10 are not as snug to the toroid as the rest. They aren't flopping around -- just not quite as snug as the others. I've counted the turns on L10 and L11 several more times and they're still as specified.

I could try re-winding L10 and L11, but they look pretty well wound and there's no guarantee I'll do as well on a second try, let alone better. I'd just be re-winding them on the hope they'll turn out different.

Hmmm... Those turns are spaced evenly around the entire toroid. Would it improve power out if I push the turns so that 85-90% of the toroid is not wrapped? I'd have to glue them in place to make them stay that way. I started off with the turns covering about 85%, but as I worked with getting the band inductors in place, the turns spread out across 100% of the toroid.

Hi Kevin, I like the comparison to the KX3, that works well.. and it shows too, that the current readings are well in the ballpark too.No potential problem there. For 30m, try squeezing the turns, (4 - 5) together ..see it there is any increase in power.. if not, or no change, try squeezing the other end together... If not, spread them back out.. and try the other toroid... same way... It might be that one or the other needs one less turn... instead of squeezing... if the current dips as you start spreading and never hits the bottom before you run out of "spread"... unsolder one end, and unwind one turn, don't cut it, but tack the end back in place. Measure again, and now try squeezing.... 4 - 5 maybe 6 -8 turns together.. one way or the other you should reach a dip in current/peak in power... if no change at all.. re-wrap the turn, and return it to what was... it will work just fine anyway.
BTW, the toggle switch on the back is leaning toward the coax connector, I'd anticipate.
Have a great day,

Hi all
Got my PRF-3A a couple of weeks ago, c36 was damaged missing on the board so I emailed a picture and asked for advice, no reply so on with the build.
Replace smd c36, group one test; half the display is not working.

Spent far too many hours checking soldering has gone through the board
voltages/earths to ic's are ok;
50mhz out of u11 and into U6 but nothing measured on the right hand side of U6 with my frequency counter?
Each resistor and capacitor measured before I fitted to the board.
S1 to 4 is operating and not stuck closed.
I can follow the circuit diagrams but I have no idea what voltages to expect where.

I have built a few things and never been stuck before.

Any advice to help me move forward will be appreciated.

Mike G0HIO

Hi Mike, Usually display issues are connection related, but you have that covered. Upon initial power up, does it light all four "8" numbers? or only two?

Have a great day,

Also, look for bridges across pins. When I smoke tested group A, my display was suddenly all whacked. Turns out, a clipped component leg was shorting a couple of the pins on the display. Took me 15 min of really frustrated searching to find it though!

4386. PFR-3 antenna tuner

Yahoo group: pfr3_group
Date: 2014-06-10 17:27:40 UTC
From: jackier1061@...
Topic: 4386 Message: 4386

I find that the antenna tuner built into the PFR-3 doesn't react like other tuners I have used. I find that it is impossible to tell when the LED is dimming.

Are there any mods that change that?

Does anyone else have this problem?

I have finished electrical construction of my PFR3a but not final assembly into the case. I have tested the radio portion to my satisfaction.

In my limited testing with a dummy load and with an end-fed through an UNUN, I have observed the same issue -- I'm unable to dim my SWR LED. I don't know yet whether I have a problem in my tuner/bridge, or if my loads have simply exceeded the design parameters of the tuner.

So you have company. Please let me know what you find and I'll do likewise.

Do you have access to a 50 ohm dummy load or known resonant antenna? That might help determine if things are working properly.

I not only use the tuner in the PFR-3, but also the Tenna Dipper, which works in a similar fashion. Both have worked well for me.

one common issue with that tuner.. is the spacing of the windings on T1.. they have been better if squeezed to cover about half of the core...not spaced evenly.. But as Jed says... a known load is a real good test... I use a 470 ohm resistor across the balanced line.. then a 50 ohm dummy load across the coax.. and the switches all in the proper spots.. that takes just a bit of study to get done too.

Have a great day,

Take a close look at the socket pins for the processor. There is a good chance several pins bent over and under the socket when installing the socket and are not sticking up out of the holes in the board as they should. Unfortunetly, if this is the case, it's something of a challenge to fix.

The first thing to check are the solder connections to the magnet wire. Even with pretinning the leads, it can be easy to pull the wire through the hole past the tinning and not make a connection.

But if that is okay, then it's mostly a matter of learning how to use it. The tuning is very sharp so it's easy to miss seeing the dimming of the LED. The fact that the two tuning controls are inter-active complicates things. You also have to pay attention to the position of the toggle switch on the rear of the case.

To learn how to use the tuner, practice at a low power setting (use a 9V supply) and some dummy loads. It would be good to have a 50 ohm load for low impedance matching and a 470 ohm load (2-3 watt) for high impedance and balanced line testing. But if all you have is a 50 ohm load, it can still be used for practice in getting a match. Use 30 meters first, as this is more or less in the center of the operatring frequency range of the BLT. Once you figure out 30M, try 20 and 40 to make sure it will work on both of these bands. If it works on 20 and 30m, but not on 40, then you'd have to squeeze the windings.

Read the instructions in the manual very carefully and follow the steps. Get the controls in the ball park first by setting LOAD to 50% and with TUNE adjusted for best signal strength or band noise in the receiver.

Transmit and VERY SLOWLY adjust the TUNE control to find a dip in the LED brightness. Then see if it can be dipped farther by tweaking the LOAD control. Now adjust the TUNE control just past the point of minimum LED brightness. Then use LOAD to dip the brightness as much as possible. If you can't find a dip, adjust TUNE back in the other direction and try again. It can take 4-5 back and forth adjustments before a total blanking of the LED is obtained.

Once you get the feel for the adjustments, it becomes a lot faster and you'll find you can match to a whole host of different loads.

Steve KD1JV
Dale currently has my PFR3, partly because I was seeing the same issue and partly because I wanted someone experience to benchmark the unit. Hoping it's an easy fix like squeezing the windings! ;)

It's probably dimming. It's just very touchy. It took me a while to actually get a feel for mine and sometimes had to dim the lights to see it.

FWIW

Steve,

Very good explanation. I will pass this on to a friend of mine who has trouble using the BLT. Nothing wrong with it as I tested out his PFR-3A and found it operating perfectly. I guess fifty years of hamming and other electronics helps!. It also helps to shield the LED.

Subject: Re: [pfr3_group] PFR-3 antenna tuner

☐
The first thing to check are the solder connections to the magnet wire.
Even with pretinning the leads, it can be easy to pull the wire through
the hole past the tinning and not make a connection.

But if that is okay, then it's mostly a matter of learning how to use it. The tuning is very sharp so it's easy to miss seeing the dimming of the LED. The fact that the two tuning controls are inter-active complicates things. You also have to pay attention to the position of the toggle switch on the rear of the case.

To learn how to use the tuner, practice at a low power setting (use a 9V supply) and some dummy loads. It would be good to have a 50 ohm load for low impedance matching and a 470 ohm load (2-3 watt) for high impedance and balanced line testing. But if all you have is a 50 ohm load, it can still be used for practice in getting a match. Use 30 meters first, as this is more or less in the center of the operatring frequency range of the BLT. Once you figure out 30M, try 20 and 40 to make sure it will work on both of these bands. If it works on 20 and 30m, but not on 40, then you'd have to squeeze the windings.

Read the instructions in the manual very carefully and follow the steps. Get the controls in the ball park first by setting LOAD to 50% and with TUNE adjusted for best signal strength or band noise in the receiver.

Transmit and VERY SLOWLY adjust the TUNE control to find a dip in the LED brightness. Then see if it can be dipped farther by tweaking the LOAD control. Now adjust the TUNE control just past the point of minimum LED brightness. Then use LOAD to dip the brightness as much as possible. If you can't find a dip, adjust TUNE back in the other direction and try

again. It can take 4-5 back and forth adjustments before a total blanking of the LED is obtained.

Once you get the feel for the adjustments, it becomes a lot faster and you'll find you can match to a whole host of different loads.

Steve KD1JV

Dale currently has my PFR3, partly because I was seeing the same issue and partly because I wanted someone experience to benchmark the unit. Hoping it's an easy fix like squeezing the windings! ;)

4396. FOXHUNT: Summer Season coming

Yahoo group: pfr3_group
Date: 2014-06-12 13:01:20 UTC
From: Dale Putnam
Topic: 4396 Message: 4396

The Summer Season Foxhunt in the 20 acre woods... is coming quicker than you might anticipate... Are you ready? The Game Warden has agreed to negotiations.. that's the first step.Gotta get into discussions, to set the dates and open the applications for FOX...Are you ready for that? Applications first.. then the Game Warden will open the season,and the hounds will run.. every week, for the summer. Grand fun for everyone.. What does it take to be a FOX?... Fluffy tail? Pointy nose?... How about a swift paw on the key?Well.. that would be helpful, but only to the extent of being able to copy 20 wpm... the summer season, is the season that can slow down and enjoy the hunt. A good antenna on 20.. would be very helpful.. but even more than that.. a good working relationship with the Prop Princess... would be great. Having the Prop Princess on your side is a good thing.. and one other.. a good relationship with Thor,would be helpful too... so that the lightning bolts don't come close at all.. during the hunts...
This Season is promising to be a great one.. lots of fun.. and one to jump into. Hoping to see you all.

Have a great day,

--... ...--

I can clearly see the processor pins on the underside of the board. I removed the processor and checked for continuity from the socket on top and underside for all 28. Then I checked for shorts between all adjacent pairs on the socket.
I have 50mhz from u11 and upto the dds chip but nothing at r9 c11 junction.

No this is not a rx problem I am stuck on stage one with half of the display not working. The final check on group one says I should have something on my frequency counter at r39/c41 and pin 20; but I don't have anything there. To clarify the dds chip is putting out 50mhz and this is present at pin 8 but no where else.
There is none of the self check on the display it just comes on with a lot of the leds not working!!

The kit is all soldered but only static on receive. Passed group 1 and 2 tests. A previous post suggested to check L1 and T1. I checked connectivity of these coils while they were soldered on the board by using a voltmeter across theirs older pads. They check out. Is this test valid? Are there other paths in the board that might cause the connectivity test to pass? Any other suggestions/test? -jaiwant, WJ0J.

Topic: 4404 Message: 4406

So .. still no receive. I tried the following:
(1) Removed, rescraped, retinned and put back L1 and T1.
(2) Checked for shorts with lens.
(3) Checked component values and electrolytic capacitor polarities.

Specifically, I also followed the receive troubleshooting steps in the assembly manual. Rechecked the secondary and link of T1. I can hear the hiss by increasing the volume and I can also hear the hum by touching pins 4 and 5 of U2. The manual says to check the voltages on pins 3 and 5 of U3 but does not mention the expected voltage so I cannot follow that troubleshooting step.

I am able to hear the side tone with I key down my straight key. Similarly I am able to hear all the menu announcements.

The white noise/hiss remains the same for all the 3 bands (there is no audible difference).

Thanks in advance for your help.

Hi to you all.
Just building up a kit for my father in-law g0was, I must say as soon as I saw the SMT soldering I was concerned.
Sure enough group 1 test failed due to L6 not being attached at one end, all well after re-flowing SMT components.
So as Andy F5TBL said, with care some flux and any of the SMT techniques show on you-tube, it should not be a show stopper,
and may lead you into SMT construction, instead of all this lead bending.
73's
Steve g7was.

Steve,

This is indeed a very good explanation of the BLT tuner in the PFR. I swore the tuner was not functioning until Keith (WA9S) carefully demonstrated how fine the tuning actually is. The interactivity of the two knobs is an added feature. If you like adjusting real knobs on your radio, this is the perfect rig!

Now I can get a match on almost any antenna I use (home antenna, Buddipole, or Outbacker) but it does take some twisting. Bright sunlight is just deadly; it's better done in the dark of night. But, once done, it does work like a charm! Your comment about the 30 meter position being the "middle" of the tuning range makes sense now. Thirty meters is always easiest for me to tune. It makes you want to start out all the time on 30 meters.

Thanks for your comments. Barry. WD4MSM

Topic: 4386 Message: 4416

Hi Guys,

Here is a very short video that shows the LED is visible pretty well on a bright day if you are under a shade tree,

Antenna 7: 160 FT END FED - PFR3 BALANCED LINE TUNER & SWR INDICATOR .

http://www.youtube.com/watch?v=GqdibNBxyBc

Jul 4, 2010 - Built-in Antenna Tuner - Minimum SWR is indicated by dimming of LED. Tuning involves setting antenna switch on back to "balanced line", selecting "High Z" or "Low Z" for either high or low impedance (i.e. voltage fed or current fed) and then adjusting two variable capacitors for resonance. Video shows how LED dims when feedline is matched. In this demonstration, 160 foot end fed wire is matched without feedline or counterpoise on 20 meters. LED works in daylight, as shown under a shade tree.

Just throwing this out there: this seems like an excellent subject for
a YouTube video. There is a demo of it somewhere out there, but it's
fast and not educational. Maybe Barry or Keith would be able to share
your knowledge?

On Friday, July 4, 2014, wd4msm@... [pfr3_group]
<pfr3_group@yahoogroups.com> wrote:

Steve,

This is indeed a very good explanation of the BLT tuner in the PFR. I swore the tuner was not functioning until Keith (WA9S) carefully demonstrated how fine the tuning actually is. The interactivity of the two knobs is an added feature. If you like adjusting real knobs on your radio, this is the perfect rig!

Now I can get a match on almost any antenna I use (home antenna, Buddipole, or Outbacker) but it does take some twisting. Bright sunlight is just deadly; it's better done in the dark of night. But, once done, it does work like a charm! Your comment about the 30 meter position being the "middle" of the tuning range makes sense now. Thirty meters is always easiest for me to tune. It makes you want to start out all the time on 30 meters.

Thanks for your comments. Barry. WD4MSM

4417. Five Antennas for the PFR-3A

Yahoo group: pfr3_group
Date: 2014-07-04 22:11:13 UTC
From: lahagar1@...
Topic: 4386 Message: 4417

Hi Guys,

Here are a few antennas that I found to work with the PFR-3 Portable Field Radio's built in tuner.

Antenna 1: 20/40 m 34 FT. END FED ANTENNA with COUNTERPOISE FOR PFR 3A
http://www.youtube.com/watch?v=3kWvXJ_5XgE&feature=share&list=PLF595C1135AC3D3A4&index=7
Jul 13, 2010 - Hendricks PFR-3 Portable Field Radio battery powered using end fed 10.4m (34 ft) wire antenna with 4.6m (15 ft) counterpoise demonstrated on 40 and 20 meter bands. This antenna is efficient and simple. Lack of a transmission line makes it suited for quick portable installations since it requires only one support. Also tunes on 30m but is demonstrated only on 20 and 40m in this video.

Antenna 2: OCF 49 FT. PORTABLE 3-BAND FIELD ANTENNA FOR PFR-3A
https://www.youtube.com/watch?v=VXo0XucRpt0&list=PLFiIJJI5T2wfclV9034h3k0SGxc6MFXTI
Sep 3, 2011 - (This antenna is essentially the 34' end fed and 15' counterpoise with the addition of a 10' parallel wire feed line.) Inexpensive Portable Field Antenna project for radio amateurs. Construction hints, "no-solder" assembly, home-brew feedline. Test notes and on-the-air demonstration on 20m, 30m and 40m ham bands using Hendricks PFR-3A transceiver. Looks like Greek letter λ (Lambda). Variable polarization depending on installation configuration. Requires ATU and single support (minimum). Stealth materials. Overall length 15m (49 ft).

TUNING NOTES FOR HENDRICKS PFR-3A and "λ-ANTENNA":
NOTE, LOCAL SURROUNDINGS SIGNIFICANTLY AFFECT TUNING; THEREFORE BLT SETTINGS ARE ONLY APPROXIMATE. AND POSITION OF DIAL INDICATORS VARIES PER UNIT. FIELD ERECTED ANTENNAS WILL ALL DIFFER; THIS IS JUST A RECORD OF ONE SPECIFIC INSTALLATION. TEST DONE WITH LEAVES ON TREE AND GROUND IN FAIRLY DRY CONDITION. HIGHLY CONDUCTIVE NORTHERN ILLINOIS SOIL. RESULTS WILL VARY.

CONNECT TOP WIRE TO RED TERMINAL, BOTTOM WIRE TO BLACK TERMINAL. ANTENNA SWITCH TO BALANCED LINE. SELECT BLT. WITH CARE, IT WAS POSSIBLE TO OBTAIN SWR MATCH AND COMPLETELY DARKENED LED ON ALL BANDS WITH ALL THREE FEED POINT CONFIGURATIONS. TUNING TAKES SOME REAL PRECISION, UNLESS NOTED THAT TUNING IS "EASY".
FEED PT HT / (POSITION OF BOTTOM WIRE)/40/30/20m:
0 ft / (15 ft FLAT ON GROUND) / 40m LO-Z / 30m HI-Z / 20m LO-Z.
8 ft / (7 ft FLAT ON GROUND) / 40m LO-Z / 30m HI-Z / 20m LO-Z.
10 ft/ (END 3 ft ABV GRD)/ 40m LO-Z / 30m HI-Z / 20m LO-Z.

Antenna 3 - SIMPLE 42 FT WIRE END FED ANTENNA FOR PFR-3A
https://www.youtube.com/watch?v=XeOwP7JtAPU
Jun 1, 2013 - 5/8 wavelength vertical wire on 20m with the PFR-3A. The 42 foot (12.8 meter) long end fed wire antenna has a banana plug that connects to one of the balanced line terminals and is tuned using the internal Balanced Line Tuner (BLT). No counterpoise. This wire antenna is simple and about optimum length for low angle radiation on 14MHz when installed vertically (as I tried to do). And the 42 foot wire works well on 30m and 40m too. On 30m the antenna is a 0.43 wavelength vertical. On 40m the antenna is 0.30 wavelength. The SWR indicator indicates a good match (complete darkening of LED) on all

bands without a counterpoise wire or ground connection using the BLT.

I recorded this example of the antenna being used on 30m with N8MRS/Mike in Akron, OH who was using his new Ten Tec Eagle. Even with the solar disruption and poor band conditions we still managed a nice QSO, that was finally ended only because of rain.

Antenna 4: 50 FOOT DOUBLET with HOMEBREW TRANSMISSION LINE FOR PFR-3A
https://www.youtube.com/watch?v=qaUN9m2u1pQ&list=PLF595C1135AC3D3A4
Aug 18, 2010 - Simple, cheap home-made multiband antenna and transmission line for QRP radio. Demonstrated on-the-air using Hendricks Portable Field Radio 3A. The little 50 ft doublet is made out of two 75 foot long pc of 20 ga. wire, no soldering, held up by a PVC tube. The PFR-3A internal ATU tuned it on all bands - 40, 30 and 20m.

Home brew parallel wire feeder was easy and fast to make. I stretched the two wires out holding hands at arms length then putting small pc of tape to hold them together. Then, repeated putting a pc of tape in-between each, and resulted in a tape every 2'-6". I folded a little tab at each pc of tape to make it easy to un-tape. One can just un-tape the feeder in 2.5 foot increments if I want to increase the length of the doublet. Or add pc of tape to hold the doublet together at a shorter length if needed for restricted space. Seems good application as adaptable portable antenna. Very simple. The light-weight parallel wire transmission line provides flexibility in the placement of the operating position

It was fun to sit on deck underneath it with 5 W. Worked MD and DC on 40 and 30m.
It did work well on 40m at reduced length. That is about 75% of full 1/2 wave dipole.
Even though I didn't have a reference antenna, at least it seemed there was no real attenuation even with about 30 feet of excess feed line strung around the deck. Signals were good on all bands, 40, 30 and 20m.

Antenna 5 - COAX FED HORIZONTAL V-ANTENNA FOR PFR-3A
https://www.youtube.com/watch?v=HciKdAHXh70
Feb 2, 2013 - PFR 3A Antenna: Simple positioning of wire antenna into a V shape can result in improved bi-directional signal strength. If two long wires are formed into a V, maximum radiation lobes are additive along a line bisecting the V. The resulting pattern is bidirectional with minor lobes to the sides of the major lobes. This horizontal-V antenna has a 90 degree angle and is one-wavelength long on 40 meters. The bisector of the angle essentially favors East-West. The antenna is 25 feet above ground (7.6m).

The antenna coax feed is matched to the transceiver with the internal Balanced Line Tuner in the PFR-3A . The station located tuner simplifies band switching. Other transmission lines and matching devices are possible. Other tuners that readily provide a 50 ohm transmitter match. Construction details: Cheap and easy, the horizontal-V antenna is fed with 125 feet of RG-6/U coax. Coax was chosen for routing convenience. 75 feet of coax lays on the ground to a barrel connector to another 50 foot section of RG-6U to feed point supported by a tree Barrel connector also allows the coax to be disconnected when not in use. RG-6/U is 75 ohm type used for CATV. It is cheap, light and durable. The type I used has an 18 AWG center wire, foamed polyethylene dielectic with a foil/braid shield. It is somewhat challenging to adapt PL-259 coax fittings, but otherwise excellent for amateur radio use because of its low cost, light weight and durability.

The V-antenna wire is 20 guage solid copper wire with HDPE UV resistant insulation -- the type sold by home improvement stores for underground dog fences in 500 foot spools. The center insulator is made from a piece of polypropelene plastic rope. The plastice rope insulator is strong and flexible. Electical connections are soldered and separate from the

mechanical connection, using separate, slack wires to protect the soldered connections from mechanical stress.

The tether cord that suspends the feed point is tied to the PE rope and the coax hangs freely below the suspender. The ends of the antenna are simply small loops in the insulated wire that serve as eyelets for the rope. There is no soldering at the ends, and the polyethelene ropes serve as the end insulators. The antenna is installed from ground level by throwing light nylon cord over the top of trees and pulling up the plastic rope that hold the ends and center feeder. This method of installing the antenna contributes to safety by eliminating climbing. CHECK THAT THERE ARE NO OVERHEAD POWER LINES BEFORE INSTALLING ANY ANTENNA. This method of antenna support also allows lowering the wires by just untying the tether cords and letting the antenna back down - for repairs or experimentation!

This last one is less suited for portable operation due to its size.

Full wave loops also work GREAT, but take a bit more time to install in a temporary location.

From: k6mgo@...
Topic: 4386 Message: 4418

When I first finished my PFR3, it seemed to me that it took over 10 minutes to tune it to any antenna, I had the hardest time, and I had been using manual tuners for years. Now, it hardly takes a minute or two, almost as if the PFR3 has got "broken in" but I know this is nonsense and it's just me, having learned how to use it. The biggest help for me, is to tune the two capacitors, Load and Tune, for max noise without transmitting. Then also peak the Receive cap and peak the Tune and Load once again. Then with the rig in Tune, steady output, it's a snap to get the LED to go out completely. I also make sure I have the toggle switch on the back panel in the right position, mostly leaning towards the binding posts, unless I'm using a balanced fed. I also check Hi Z and Low Z and leave it in the position with the most band noise when tuning. Your mileage may vary, but this works for me. I use dipoles fed with 300 ohm TV line, 450 ohm window line, coax fed end fed dipoles, small mag loops and random wire lengths and my little Super Antenna MP-1 whip antenna. They all seem to work now.

4419. Wrong Voltages around U8

Yahoo group: pfr3_group
Date: 2014-07-25 19:48:26 UTC
From: peter.c.w.jacobi@...
Topic: 4419 Message: 4419

Hi,

during Build of the PFR3a everything worked as expected until I came to the Pretests before inserting L7.
Everything is as described, but the Voltages of Pin 1 and 13 are 0 even during Keying.

Pin U
1 0
2 0
3 5
4 0
5 5
6 0
7 0
8 0, with Key:0.92
9 0
10 5
11 5
12 0
13 0
14 5

So only Pin 8 rects on the Key. I exchanged the IC, resolderd the connections related to the IC, but no change. My ICType is 74HC02n

I then analyzed the Circuit diagram and I do not understand the following Part:

Pin 2, 10 and 12 are connected to the Ground. How can 10 have 5 V then?
Pin 3 and 11 are hanging into the Air?
Maybe the Groundsymbol should belong to 3 + 10.

Nevertheless, it doesnt work.
Any Hints?
Thank you very much,

Peter DL4PJ

4420. Re: [pfr3_group] Wrong Voltages around U8

Yahoo group: pfr3_group

From: Steven Weber
Topic: 4419 Message: 4420

There is a slight error on the schematic and in the voltage table for the 74HC02.

Pins 2 and 10 should be shown connected to ground and pins 3 and 11 connected to pin 10.

Therefore the voltage table should have the values of Pins 2 and 3 along with pins 11 and 12 swapped.

But your problem is apparenly the voltage on pin 8 not going high enough to trigger the gate. Make sure you do have a 100K resistor at R37 and check the soldering to pins 16 and 17 at the DDS chip, where the signal originates. Just touching the tip of a soldering iron to those pins should fix the problem if it is there. No need to add solder, that will just cause problems as likely too much will melt on and you will cause shorts between the leads.

And since this is an RF signal on these pins, some meters will not measure correctly and cause loading.

Steve

Having just built a PFR-3 for my Ham father in-law, I would say the transceiver is very good. All new builders should not expect the schematic to be correct and up to date and more importunately the SMT soldering can not be trusted, as a number of builders have found out. So re-flux and re-flow is the order of the day.
My kit came with a surplus of caps and resistors, but only one BS170 I think it was and a shortage of one value of resistor. Come on, the only thing you need to do when kitting a project is provide correct info and all the parts and if you are going to do the technical SMT soldering the do right.

From: vb3298@...
Topic: 4423 Message: 4423

I have a sporadic problem with my PFR-3A. On occasion after tuning up or down, when I release the tune button, my readout will hop momentarily through the other two bands and finally settle on the band that I am operating on. I'm not sure if it is the same problem and documented fix in message 3915 :"slight bug in pfr3 SECOND REQUEST". I did try a .1uF cap across the menu button, but the problem is still there. I assume that cap was to take care of potential switch bounce. I would appreciate any suggestions on a fix?ValWD4EXI

Same problem here too.
My first PFR-3A had the problem.
Did the mod of the capacitor and problem was reduced but still present.
Batteries leaked and destroyed the board.
Just assembled a second PFR a couple of weeks ago and the problem is also present on this newer one. Mention this because it is clear the problem seems not to be related to the version of software in the PFR.
Shows up mostly when you are going up or down and you press the buttons repetitively too fast.
Will keep an eye on this thread. Even though... Have the feeling will end up with us getting used to it.

Thanks for posting it.

Dale,
Many thanks for your reply. I read the instructions which you are paraphrasing a number of times before posting my question, however, the instructions are not helpful in this case. It appears, in fact, that the instructions are wrong in this particular case. I have posted a new album titled "Capacitor polarity ambiguity" which shows three photographs of the capacitor in question. You will notice that one of the leads is folded over onto itself making both leads effectively the same length. This is how the capacitor was supplied in the kit. Even if one considers the folded lead to be the "longest" lead, the marking on the capacitor appears to indicate that this lead is the NEGATIVE lead, not the positive lead.

Don't want to install these caps until I know what is going on.

John

Hi John, I can relate.. I've gotten caught with that a couple times... especially when working with a lack of attention. The caps are marked on their sides.. with a minus sign in an arrow, pointing to the negative lead. On the pc board, for the PFR-3 is a + sign, next to the positive lead of the cap... be real sure to put the arrow on the cap.. to the blank hole.
Have a great day,

Subject: RE: [pfr3_group] Electrolytic capacitor polarities.

Dale,
Many thanks for your reply. I read the instructions which you are paraphrasing a number of times before posting my question, however, the instructions are not helpful in this case. It appears, in fact, that the instructions are wrong in this particular case. I have posted a new album titled "Capacitor polarity ambiguity" which shows three photographs of the capacitor in question. You will notice that one of the leads is folded over onto itself making both leads effectively the same length. This is how the capacitor was supplied in the kit. Even if one considers the folded lead to be the "longest" lead, the marking on the capacitor appears to indicate that this lead is the NEGATIVE lead, not the positive lead. Don't want to install these caps until I know what is going on.
John

Dale,
I actually posed this question to Steve, steve.kd1@gmail.com on Weds. as instructed by the QRP kits web site. I received an answer yesterday which, again, was not helpful because of the nature of the situation so I sent the photos to Steve yesterday and am waiting for a reply. I guess I'd better call their phone number and see if anyone can help.

John

Dale,
What I'm seeing is a capacitor with a longer leg which appears to be marked NEGATIVE by a white stripe on the side of the cap.

Just spoke with Steve and Doug. They advise that the long lead of this cap is in fact the Negative lead.

Yes... that is what I said too.. HOWEVER.. this is NOT the normal for caps found in almost ANY other location, even from QRPkits. So.. your caution is very founded.

Have a great day,

I found that the short lead wouldn't reach the board to lay the capacitor down, so this was one of the parts I had to replace.

Dear John,

In my kit I had the same issue.
I installed the Caps according to the markings on their housing.
The white bar marks minus. It works since one month, so I assume it's OK.

On the german Wikipedia you find this image:

http://de.m.wikipedia.org/wiki/Elektrolytkondensator#/image/Datei:Polarity-wet-Al-Elcaps.jpg

So following the signs on the housing is correct.

Sigh... These kinds of issues are the bane of my existence (I work in security). This is likely the hosting company/commerce company's fault. Cheap hosting companies often run out-of-date servers with vulns that hackers take over and exploit to serve up malware.

Recommendation: anyone who has visited the site, grab a free download of Malware Bytes and scan your computer.

Next recommendation: make sure automatic updates are enabled.

Next, don't run XP. No more updates... If you won't buy a new computer, switch your old box to Linux Mint or another lightweight *nix OS

If you are on Windows, install the Microsoft EMET tools (they are also free).

If you have a web site, double check that the hosting company is applying updates. If not, go somewhere else. The switch is inconvenient, but not as bad as this kind of bad press.

Hmmm... I used to have Doug's email, but the address I have bounced just
now. If he's on this DL or if someone knows a valid address, I would be
glad to offer some help, free of charge. He's done plenty for the community

and I would be glad to give back.

If anyone here has a working address, please forward him this email and have him get in touch. I'm happy to help out in forensics, clean up, or recommendations going forward. I'm a certified incident handler and run the security services organization for Caliber a security partners.

Thanks for the forward...

Jerry:

I don't claim to be a security expert, but my IE (Win 7) lets me "into" QRPKits.com without a warning. I wouldn't assume it's safe just because you're running another OS or browser. Someone may have inserted code into the site to glean personal information regardless of the OS/browser.

Hi:

FWIW, the Google browser will show you the "Diagnostic Report" explaining why it puts up the message when you visit qrpkits.com. You still have the option of visiting the site anyway.

Here's the deal: if you're using Chrome, the browser has built-in reputation checks. QRPkits.com has been blacklisted due to the virus. So some users are seeing Google's anti-virus warning (those running Chrome with reputation checks enabled) and others are not.

I've been in contact with Doug and have been doing some research. The web master claims to have eradicated the malware and I haven't seen any yet in my work so I'll take that at face value. Doug and the webmaster will need to work with Google to get the reputation repaired.

John,

actually qrpkits got black listed because one person reported it as malware. The script has been removed and we are waiting for Google to make another scan.

Someone also mentioned that this could be the result of a low cost ISP provider and this is not so. QRP Kits is hosted on BlueHost/HostMonster. I have also asked them to review the site which they did and they did not find any malware on it.

So assuming the Google will do the scan everything should be back to normal tomorrow.

4465. FOX APPs accepted

Yahoo group: pfr3_group
Date: 2014-11-11 03:50:44 UTC
From: Dale Putnam
Topic: 4465 Message: 4465

Need a few hearty souls for 80m, Please? and you might as well apply for both....

The Winter QRP Fox Hunts on 40 and 80M begin this Tuesday, the 11th. It's a great opportunity to stretch out and expand your CW operating skills and just a whole lot of fun.

In each "hunt" there are two QRP Foxes, operating within 10KHz of the QRP frequency, and everybody else tries to find and work them, with a simple exchange. Sounds simple, but at there might be 50 or 60 stations calling each Fox, at the same time. The successful Hound is the one who is patient, and takes the time to figure out exactly how the Fox is operating. In other words, how to get through the pileup.

The successful Fox is the one who can figure out how to efficiently work his way through the pileup and has great ears to dig the odd Hound out of a hole in the noise floor..

It's a lot like DX, only at QRP power levels, and operating on a schedule.

Each QRP Foxhunt starts at 0200Z (0100Z during Daylight Saving Time) and lasts for 90 minutes Fox logs with over 100 QSO's are common given any sort of propagation.

At the end of the season (i.e. next April) there will be certificates for the Hound who has worked the most foxes (out of the 40 possible) and the Fox who has worked the most Hounds.

The "official rules" do a better job of explaining this and you can see them at www.qrpfoxhunt.org That's also where you will find a sign up for the QFOX list, which provides a discussion forum for Foxes and Hounds throughout the season. Schedule and progressive results are posted there too.

We're still working on the Fox roster for the coming season, so if you would like to try your hand at being a Fox, please complete the form you will find on the websiteL www.QRPFoxhunt.org. We'll see if we can find a Fox Hat to fit you.

We (QRPers) have been doing this since 1997, and it's still fun!

4466. Frustrated

Yahoo group: pfr3_group
Date: 2014-11-17 14:06:48 UTC
From: slashrick@...
Topic: 4466 Message: 4466

sigh.
I am about to offer up my pfr-3 to the first bidder.

but before I begin my rant, let me state my desired outcome.

Desired: I want my PFR-3 to work well enough that it is at least as good as my SW-40+.

How to get there: I want someone to fix it for me, so that it works.

Problems: barely receives, barely transmits, frequency changes mid-qso, yahoo groups has either gotten stupid (i.e. unable to get any useful info out of it, because yahoo sucks), or I'm am way too 'old school' for what yahoo has become. (i.e. i cant even figure out how to search inside the group)..

so, what i want to do, is send my poor little badly working PFR-3, to someone (cant figure out who, because i cant search effectively inside this group), who can make it work.
i will give whoever this is money (real cash money) to accomplish this.

i have been fighting with this radio for 2 years now, with little joy.

please, someone, make this easy for me.

thanks

Hey Rick, I apologize that I didn't see any of your posts. Please.. let me help. Send it to me.. I'll return it meeting or exceeding published specs.After you are satisfied that it meets or exceeds specs, you are responsible for the shipping (find that amount on the box it arrives in.. typically less than 10.) IF you want add something,that would be very appreciated. IF I have to use parts, I will include their cost on the spec sheet, that I email to you.
No need to be unhappy with that radio.. not at all. now.

Priority Mail.. in a small flat rate box works well.. Just remove the knobs and posts... put that into a baggy and include it with the radio. Send to:
Dale - WC7SQuality Electronics.5503 N. College Dr.Cheyenne, Wy. 82009
IF you want to, ok?
Have a great day,

Subject: [pfr3_group] Frustrated

sigh.
I am about to offer up my pfr-3 to the first bidder.

but before I begin my rant, let me state my desired outcome.

Desired: I want my PFR-3 to work well enough that it is at least as good as my SW-40+.

How to get there: I want someone to fix it for me, so that it works.

Problems: barely receives, barely transmits, frequency changes mid-qso, yahoo groups has either gotten stupid (i.e. unable to get any useful info out of it, because yahoo sucks), or I'm am way too 'old school' for what yahoo has become. (i.e. i cant even figure out how to search inside the group)..

so, what i want to do, is send my poor little badly working PFR-3, to someone (cant figure out who, because i cant search effectively inside this group), who can make it work.
i will give whoever this is money (real cash money) to accomplish this.

i have been fighting with this radio for 2 years now, with little joy.

please, someone, make this easy for me.

thanks

I almost couldn't find it, but I've pasted the thread below. Sadly, my PFR
has reached the 85% finished stage and been set aside. I have to do final
assembly and calibration, and I hate final assembly.
Good luck with your radio!
Kevin / K4KPK

Stephen Smith <sigcom@...>
May 14
to me
Hi Kevin,

You likely have an errata sheet for the PRF-3, not the PFR-3A, the current
kit version. You should be using the "updated 03/01/10" manual revision.
Follow that and nothing else.

An errata for a PFR-3 will only get you confused. Where did you get it?

to Stephen
Hmmm... http://www.qrpkits.com/pfr3.html is the page from which I ordered
my PFR-3a and downloaded my PFR-3a manual, but it sounds like it has erratafor
the PFR-3.

I'm relieved to hear that the 3/1/10 manual is all I need. I never did
like errata.

Thanks for the help

Ned,

I know this is an old post, but I have to ask if your PFR-3A has been sold. Since I have never built a kit, I'm looking for one already built. I figure it doesn't hurt to ask.

David

never built a kit? well the recommended progression is to start with something easy, and also low cost.

the critical milestone is making a good solder joint. once you do this a few times successfully, there isn't a huge deal in later doing it for something more complex.

a simple kit could be an electronic keyer or something with just a few parts. idea is to build your confidence (pun intended).

beyond this, the challenge of a PFR-3 is to properly identify all the parts, and get them properly oriented (for things like diodes, transistors, ICs and polarized capacitors).

yes a local support person (another ham that has built and troubleshot stuff) is definitely recommended, or an extra dose of patience might also work.

when/if you land or birth one - enjoy tickling the ions with it

Curt's right. David, I hadn't soldered a thing prior to 2009 or so. Had a couple elmers help me out, then I built a series of increasingly-complex kits starting with a simple balun, installing a W4RT "One Big Punch" kit, building a Rockmite, then building an Elecraft T1 tuner. From there, I bought a PFR3 but didn't start onto it for a series of reasons (life got in the way). You can find my blog on building the kit at http://k7jto.blogspot.com

My kit worked and bench-tested at or above data sheet expectations (which surprised no one more than me). So my PFR is "living proof" that if you are careful, try to be neat, and follow directions you can build one successfully.

This can be done.

I can't see wasting my time building some tiny cheap kit.
My first real build was the OHR 100-A and I made one mistake and that was putting a chip socket the wrong way but I spotted that doing my second time going over my work.
My next build was a NC 40-A then I built another and made the 5 watt mod.
My biggest challenge was building the NC 20 RED HOT Radio
Then I built up the Red Hot Radio for 40 meters.
I just took my time,double checked every part at least 3 times.
A long time ago a ham told me to take my time,do it right and do it once.
I still have those Red Hot rigs today and they are spot on frequency
Just my 2 cents on the topic.

The PFR 3A kit, in a word, is SUPERB! At $260 plus shipping, it is a GREAT deal for a three band rig with all the HANDY features needed in a take-along radio: digital display/ATU/keyer/internal power supply!

As a first QRP transceiver kit there are many options. The PFR 3A would be OK. As I recall, the PLL circuit is nearly a no-brainer to align. I admit I did have some trouble obtaining all the parts needed. Hendricks eventually came thru, but someone just starting out might not have the patience for that. And I have noticed some folks can't seem to understand how to obtain the current building instructions from the web site. I wasn't too fussed about any of that, and I hope more people find out what a great little radio the PRR-3A is.

But if you are just starting out, in my opinion, a couple simple kits would be the way to begin. One very rewarding project was the direct conversion mono band receiver Ten-Tec sold. It would be ideal for use in learning how to identify parts, create good solder connections and tune a radio circuit by means of a threaded powdered iron core inductors inside shield cans with a plastic insulated tool. I don't know if Ten-Tec still sells it. If not, that is a shame.

If you don't already have a QRP power meter/SWR meter, I would build one as a project. I would also build or buy a 50 ohm dummy load. You will need both of those to build and test a QRP transceiver.

For a beginner QRP transceiver I highly recommend the 40m MFJ CUB. It has a low parts count, it is well designed and mine came without any missing parts. All the tiny Surface Mount Devices are factory installed. Assuming you have a ham transceiver with accurate digital display, that will be all you need to get the CUB aligned, transmitting and receiving with on the right frequency. This is done by adjusting threaded powdered iron core inductors with a non-metallic tool. And if you order it thru the ARRL (for $118 including shipping std rate that arrived within a week) you can get a package deal that includes a nice book with plenty of info on Low Power communications. Bonus: The bound book includes CLEAR and easily followed instructions for building the CUB.

The Ten Tec T1300 QRP transceiver would be, in my opinion, a little trickier to build because of the method of adjusting the toroid inductance in the local oscillator. It is an excellent performing QSK radio, that might just take a bit longer to perfect ($124 plus shipping). Some videos to show how all these little kits, PFR-3A, Ten-Tec DC receiver, CUB and Ten-Tec T1300s work are at www.YouTube.com/NG9D

Hi John,

Thanks for your post and for your suggestions. I just checked out your blog on the PFR3 build. Good stuff. However, I won't being needing to build the PFR3 any longer as a member of the group had one for sale and I made a deal to buy his. However, I do plan to start building small kits to get the experience to build more complex kits. I appreciate your encouragement that it can be done.

Hi all,
This is GM4VKI over in SOGGY Scotland .I've just sent in an article to the GQRP Sprat magazine with 5 Mods in it, for the PFR3 if anybody is interested.
Mod:-
1 variable xtal filter
2 variable bfo
3 small 5.1v reg supply for above
4 variable audio bandpass filter
5 RX RF amplifier.
have fun
cheers
Roy

Don't know of any mods, I built mine about 4 or 5 yrs ago.
Tri-band, qrp, Kit, support. I don't know of anything else to do. I did use scope, beacon, and freq. counter to align. I have had a blast with mine and have used it till paint has wear spots. It is tossed in a backpack and carried around like a gud guitar tossed in da back seat and taken to the beach often. I did spread and collapse windings on toroid's for each band to get best results, I also inquired through the group advise on hot gluing torrid's, was told it was UN-necessary. I believe that to be true. all else was str8 fwd.
gl hv fun

From: fghester@...
Topic: 938 Message: 4485

PFR-3 excess to my needs. This is the original, not the "A". Works well on all bands. Appearance is very good, never exposed to smoking, and works well. I've even made stateside contacts with it from Oahu! AF output is known to be a little low on these rigs but using good earbuds, with the volume up, solves the problem. I built half of this rig then, due to 60 hour work weeks, sent it to WC7S who completed build, testing and alignment. It was completed in early 2010. Probably has about 100 QSOs on it. $275 shipped / insured anywhere in CONUS. Thanks! / WD9F fghester@yahoo.com (please respond off list). 72!

From: k6mgo@...
Topic: 4488 Message: 4488

I am really stumped by this one, maybe someone out there will know the answer.

I have used Reverse Beacon Net for several years now to tell me how my antennas work and how propagation is doing and think it's the best since sliced bread. For those of you who don't know about Reversed Beacon Net, it's a group of hams all over the world who use their rigs to monitor the CW portion of HF for anyone calling CQ and send back a signal report with time, date, freq. code speed and SNR. All you have to do is go to Reversebeacon.net and click on DX Spots and Spot Search and enter your call.
Anyway, had been working on my PFR3A and wanted to make sure it was working alright so the other day I setup my indoor doublet and connected it to the PFR3 and sent out a CQ using the built-in memory keyer first on 20m then on 30m and finally on 40m without getting one report back, which is very unusual. At first I thought that propagation was bad as it was about 2PM PST. So waited till the evening when 30 and 40 meters picks up. And tried again. Again no reports back. Checked the power out of the rig with a dummy load and RF detector and DVM and got full 5 watts out to 4.5 watts on all bands, both out of the coax connector and the binding posts. Happened to have my FT-857D sitting here along side of the PFR3 and so I connected the same antenna to the 857 set at 5 watts out, and sent CQ with the memory keyer and on the first CQ I got a 25dB report from a RBN station over 500 miles away, Tried the other band, (30M) and same thing. Hooked up the PFR3 to the antenna again and sent out CQ's over and over with the memory keyer and no RBN "hits". So I now am thinking somehow the rig isn't putting out any RF. But just went on 40m and putout a CQ and a guy 925 miles away answers me, and we carry on a nice 10-15 minute QSO and after I signed with him, a guy in Phoenix AZ comes back to me and again we have a nice QSO. This is on the PFR3.

So, the mystery is why does the PFR3 work on a QSO just fine, but won't get returns from RBN where the 857 does?

The only thing that I can think of is that for some reason the RBN stations are getting the call letters from the PFR3 and do get them from the 857, but I am not sending by hand, I'm using the memory keyer, so the code coming out of the PFR3 should be good enough code for RBN to decode it. I'm completely stumped, anyone have any ideas?

73 & Happy Holidays to all,

Bill, k6mgo

Welcome to the world of CME and Solar Storms... Where a signal can be 20 - 30 over 9... one minute and absolutely nothing the next.
Check the toggle switch on the back of the PFR-3, make sure, it is in the correct position.Check the slice switches.. to insure they are in the correct positions. BLT - Coax, Tune - Operate, Low - High
If all that works... just get on the air and call... maybe the infrastructure for RBN wasn't working... for a few minutes....

Have a great day,

At first I thought that propagation was bad as it was about 2PM PST. So waited till the evening when 30 and 40 meters picks up. And tried again. Again no reports back. Checked the power out of the rig with a dummy load and RF detector and DVM and got full 5 watts out to 4.5 watts on all bands, both out of the coax connector and the binding posts. Happened to have my FT-857D sitting here along side of the PFR3 and so I connected the same antenna to the 857 set at 5 watts out, and sent CQ with the memory keyer and on the first CQ I got a 25dB report from a RBN station over 500 miles away, Tried the other band, (30M) and same thing. Hooked up the PFR3 to the antenna again and sent out CQ's over and over with the memory keyer and no RBN "hits". So I now am thinking somehow the rig isn't putting out any RF. But just went on 40m and putout a CQ and a guy 925 miles away answers me, and we carry on a nice 10-15 minute QSO and after I signed with him, a guy in Phoenix AZ comes back to me and again we have a nice QSO. This is on the PFR3.

So, the mystery is why does the PFR3 work on a QSO just fine, but won't get returns from RBN where the 857 does?

The only thing that I can think of is that for some reason the RBN stations are getting the call letters from the PFR3 and do get them from the 857, but I am not sending by hand, I'm

using the memory keyer, so the code coming out of the PFR3 should be good enough code for RBN to decode it. I'm completely stumped, anyone have any ideas?

73 & Happy Holidays to all,

Bill, k6mgo

4490. Battery Status Indicator for the PFR3A

Yahoo group: pfr3_group
Date: 2015-01-23 21:20:55 UTC
From: k6mgo@...
Topic: 4490 Message: 4490

Need some help here with a Battery Status Indicator that I built for my PFR3. I'm pretty sure that it was working when I built it, but due to not going out in the field and using the rechargeable batteries, I just recharged the batteries, and left them in the case, using a external AC PS to power the PFR3. Every time I would push the button, the LED would glow "green" so I thought that the batteries were just holding their charge. Came to find out that they were depleting but I didn't know it till I measured the power out with my meter. Doing the calibration and set-up for the BSI I discovered that I can set the red led to light on one end of the pot, and have the green led light at one end of the pot, but they don't change, or go on and off with voltage change the way they are supposed to.
I looked in the manual and find that on page 19 where the schematic is supposed to be, it is blank. And there is no voltage charts or any troubleshooting help what so ever in the manual. I am very limited with test equipment, just having a DVM.
I tried sending an email to Dan Tayloe and asked for help but got no answer, and I see that Doug is out for an operation, so was wondering if anyone has any info that I could use like a schematic and or troubleshooting help. It sure would be appreciated.

HI Bill..
The dvm is all you need to set it up...
attached is the manual..
that should help out a lot.
Sounds like the setup of the red and green may have gotten out of calibration....??

Have a great day,

Woody,

I was able to obtain extra thumb screws from QRPkits.com, the distributor for my PFR-3A.

Hi:

I took a quick look at Home Depot. I don't have my PFR3-A in front of me, but they have #4/40 knurled 1/2" screws available. Not cheap, but they have them.

Again, don't have the rig with me while I write this, so I am not sure of the length or size.

Good luck.

Are these now stock with the kit? I bought an early kit without them, but Doug later offered them for cost of postage. Maybe mailing a couple dollars and requesting four of these screws might work, if they arent stocked at local hardware store. They are handy to users of internal batteries.

One other item is I found a small padded lunch cooler to be the perfect carrying case, but don't ask me where to get them as mine was a work freebee. It has just enough room for the pfr3 and some headphones.

Hey guys,
I did a search and found many places selling the 4/40 crews.
I picked up a box of a 100 count from ACE hardware
Problem is their buried in one of 3 boxes loaded with parts
Check out Amazion.com.

4512. Frequency hopping while tuning -- bug found and FIXED!

Yahoo group: pfr3_group
Date: 2015-03-22 21:31:10 UTC
From: k6bs@...
Topic: 4512 Message: 4512

Many of you have experienced sudden band hopping while tuning your PFR3A.
This was the only bug that was interfering with my pleasure of operating such a nice rig.
I was able to track down the cause in the firmware and was able to fix it by adding only two
new instructions. I just posted the updated source code (pfr3a_a.asm) and the hex file for loading into
a programmer (pfr3a_a.hex) in the firmware folder.

I hope you can try this and give me any feedback that you would like.

best regards..... Harlan, K6BS

If I may, a quick follow up. The other day I had my budipole up, albeit not well dialed in for any particular frequency. Hooked it up to my PFR and scanned each band--nothing at all. While on my 817 I could here one or two faint signals, the budipole was basically silent. I'm thinking that is because I didn't have the switches set up right...

Would the budipole be considered a resonant, or non-resonant, antenna? Would that change if it had been dialed in correctly?

4517. PFR3 intput to PA

Yahoo group: pfr3_group
Date: 2015-04-11 12:55:38 UTC
From: Stephen Havriliak
Topic: 4517 Message: 4517

Hello Group,
Has anyone used the PFR3 as an input to a rf power amplifier? In particular I was wondering about the 50 Watt PA described in the link below. I would be interested in hearing about your thoughts and experiences.

Steve, KC3ANQ

Simple Cheap 50W PA - A homebrew IRF510 RF Amplifier

4518. Re: PFR3 intput to PA

Yahoo group: pfr3_group
Date: 2015-04-15 17:03:51 UTC
From: wb8yyy@...
Topic: 4517 Message: 4518

Well sounds like no one has admitting they have made their PFR3 more QRO. I confess that seeing I have higher power rigs in the shack, the compulsion to build a small amp for a QRP rig is a bit less. The main aspects of a useful amplifier are to work with the PFR-3's available transmit drive to make more watts, and provide a path around the amplifier on receive (that might require a control signal from the PFR-3 to operate the external amplfier, or a power sensor within the amplifier to engage TR).

How high to go in power requires a little risk management. 50 watts may result in those loud gunshot-like sounds in destroying a few devices (??) while a bit less power should be easier. NM0S has a nice article in QST on a modest power amplifier. In the past I had seen some kitted amplifiers, so you might research this to see what currently may be available - or decide to go the homebrew route. Sometimes these higher power amplifiers use high voltage power supplies to reduce the complexity of the PA output network -- this might be worth exploring as well. Note that a 25 watt amplifier would be just one S-unit lower than the modern 100w typical rigs, so it is a worthwhile consideration.

4519. PFR3 MODIFICATIONS

Yahoo group: pfr3_group
Date: 2015-04-16 10:34:31 UTC
From: rkavampsev@...
Topic: 4519 Message: 4519

Hi all Im uploading some modifications that i have mede to my PFR3, the original article is in the GQRP magazine SPRAT current edition .
Below is the text for the ccirciut mods but the whole lot will be put in the file sections.
cheers all and enjoy .
Roy
GM4VKI

HENDRICK PFR3 RECEIVER MODS

I seem to have a attraction to PFR'3s don't ask me why, but having built and then sold on two already when another came up for sale on our Favorite Auction site in an unfinished, un-working state, I just couldn't miss it. It was bought at a ridiculously cheap price and duly arrived in the post. I was delighted to see that unfinished was in fact "it didn't have the case on" however the board was populated complete but not working. The board itself is well designed and the hard to fit SMD devices are already pre-soldered onto the board so I was pretty confident that they were all ok. Quite a lot of dry joints later and an SL612 replaced brought the RX to life, the TX once again a few dry joints and bad soldering made this part function. So now having a working PFR3 how could I break it !!!.
Well first of all my favourite band was 40 and I do like to listen to SSB as well when portable. But the I.F. and Audio bandwidth is tailored for a 300HZ bandwidth specifically for CW reception. One "Field Friendly Radio" I have always fancied is the KX1 and so as the two ccts are very similar I decided to modify the PFR3 RX. In line with the KX1.
The first mod was to copy the idea of a variable Xtal Filter and so having purchased a selection of varicaps from GQRP Sales MV109 and MV209, I set to to butcher the PFR3.
First of all build a small 5.1 volt regulated supply using a 1k resistor and a 5.1 volt zener across the i/c 12 v supply to give a stable supply voltage to pull the varicaps with. Call this supply A+
See fig1

XTAL FILTER MOD.
Remove or don't install C8,C9,C10. then build up piggy back type construction on the underside of the board by doubling up 2 x 100pf capacitors and wiring in series with a MV109 to replace C8, C9, C10. feed each MV109 through a 100k resistor and then feed all three 100k resistors from a 100k pot from a 5.1 v zenered supply with a 0.01uf across the pot output. As per the circuit diagram and photo. Fig2
BFO MOD
Like the xtal filter mod, C16 is removed or not fitted and a MV209 is placed across C16 fed by a 100k resistor from the centre of a 100K pot
See fig3

AUDIO MOD
This mod widens the audio bandpass so SSB signal can be heard. Remove or do not fit C21 fit one lead of, or unsolder one lead or C21 from the output side of V3A Pin 1 and between the output and the free end of C22 fit a 10k pot . see fig 4.
RF AMP MOD.to increase the gain on RX I tried to fit a FET (2N3819) between the top of L1 and C4. this did infact increase the gain so much that instability crept in so further work

is required here. See fig 5
The three pots were mounted on a small shelf made out of PCB board with a ribbon cable slotted through the PFR3 main board.
Was it worth it. Well I personally think I have a more flexible radio and easier to tune and listen to.
Have fun
Cheers
Roy

4524. Re: Frequency hopping while tuning -- bug found and FIXED!

Yahoo group: pfr3_group
Date: 2015-05-17 23:06:52 UTC
From: k6bs@...
Topic: 4512 Message: 4524

All: I just uploaded a new version of the pfr3a firmware. I realized yesterday that the pfr3a_a version, which was to fix the frequency hopping problem, was not the final one, so it had bugs that disabled the reading of the EEPROM. The new version was uploaded today to the final version -- pfr3a_b.
I appologize to anyone who programmed the pfr3a_a version and had difficulties. Please report any problems ASAP. Best regards,
--- Harlan, K6BS --

Hello, Inoue-san:
I will be glad to help you with the programming information, but please give me a few days. I usually use a Linux computer with a serial RS-232 port for programming, so I will have to research all of the steps required for the Windows PC.

I am just now trying out a USB interface using a Windows 8.1 laptop, however, I also have a Windows xP desktop which should match your configuration. Once I have the details worked out, I will write them up and send them to you.

Basically you will need an Arduino Uno board (basic, R2, or R3 will work). You will have to download the Arduino software from www.arduino.cc http://www.arduino.cc (This is free). You will also have to build up a small programmer board to plug the microcontroller into, because the PFR3A does not have the connector necessary to program the microcontroller on board. The programmer board is very simple and needs only a few parts. I will give you the details for this. The purpose of the Arduino Uno is to interface between the USB port on the PC and the programmer board. The software application for this interface is provided in the Arduino software package.

best regards... Harlan, K6BS

Hello, Bob
I don't have a PFR3, but if you are having a similar problem with the frequency suddenly hopping when you are tuning, then it probably is from the same cause.
I could look at the code and make the same fix to the *PFR3.asm *source code and put out a *pfr3_beta.hex* file for you or someone else to try out.

Because of the interest level I am seeing, I think I will post my programmer info on the pfr3_group site for all to use; however, It will take a little while for me to gather the info and write it in a clear way.

regards...Harlan, K6BS

Hello, Bob, I looked over the code for the PFR3. It is quite different than the PFR3A, but it looks like it should not have the frequency hopping issue. It could have a bug in a different spot, however. Please confirm that your rig has this problem.

Regarding the ATS4 -- I am not familiar with this rig at all. I am not a member of the Yahoo group for this one, so I don't have access to the documentation. If you could tell me the part number of the microcontroller, I could give you an answer.

regards.... Harlan

Jim

a few thoughts that come to mind --

(1) identifying what made you change your mind about building it? if you had not built stuff before, then building a simpler warm-up kit would give you experience and confidence.

(2) you are not far from the Norcal QRP gang - maybe someone lives close by? either to locate a builder, or bail you out if you need help.

(3) there are a few QRP builders around, and maybe one lurking here.

I don't remember anything unusual in electrical assembly. The mechanical assembly is a little involved. yes good idea to understand what you are getting into - and its a fun rig to operate at home or away someplace.

Jim,
Do not deny yourself the enjoyment of the build. Build a pixie
first, then maybe another direct conversion that requires toroid
winding, do the inventory on the pfr-3 identify and understand. Do the
smoke tests, It was one of my funnest builds, a great pfr-3 group, and
the lil bugger works real well using my outbacker i am back pack
portable. the hardest part for me was decals but then again at 56 yrs
old i still git glue on the windows of model cars HI HI

Is this firmware fix applicable to the original PFR3?

Yes and no. The fix is applicable, but the complete firmware for the "A" is not. In the original PFR the mute is active low while in the A it is active high. Also the wiring of the LED display is different so all the display look up tables have to be changed. I think some port functions got moved around too.

The ATS4 uses a different processor then the PFR rigs so it needs a different programmer.

Steve KD1JV

Keep the group update de about what is needed to flash the microprocessor. I tried to flash my ATS4 without success. Any idea of if the Arduino flasher would work?

Thanks, Steve and Andre

That is a good reference.

One thing I failed to mention in my writeup is that the avrdude.conf (configuration) file must be available to avrdude.exe. If avrdude cannot find the conf file you will get an error "can't open config file". I have the conf file in the same directory as the exe file, so I don't need the -C option to be specified.

Hi Harlan-san and all;

Today, My PFR-3 got a new firmware (pfr3a_b.hex) by Harlan’s advice.
I had freq. hopping problem in tune and RIT.

I use RIT when it’s hopping and lost signal. Now new firmware fixed this issue.

Thank you very much for your all help !!

4548. SOTA Activation Tuesday

Yahoo group: pfr3_group
Date: 2015-06-19 14:48:59 UTC
From: John Overbaugh
Topic: 4548 Message: 4548

Good morning! I will be summiting Deseret Peak Tuesday late morning MST, and operating QRP portable while activating the summit. I expect to be on 20m SSB somewhere around the QRP watering hole.

Deseret Peak has Utah's fourth highest prominence, is the tallest Peak in the Stansbury range, and has been a goal of mine for years. Later this summer, I will be activating Kings Peak, the highest peak in Utah both in terms of elevation as well as prominence.

Hope to meet you on the bands!

4554. FOXHUNT Summer Season Opener

Yahoo group: pfr3_group
Date: 2015-07-01 00:31:32 UTC
From: Dale Putnam
Topic: 4554 Message: 4554

The Game Warden, has done due diligence... and finally buckled to extreme pressure,
has agreed to allowing the FOXHUNT to proceed this Thursday, in the 20 acre wood.
The commencement celebration will kick off at 0100z Friday morning (GMT) or 7pm MT Thursday evening,
somewhere between the two trees - 14.050 and 14.070... with two outstanding FOX to be pursued,
caught, and de-pelted. De Pelts consist of exchanging RST SPC (state, providence, or country) op name and power
all this is to be accomplished with 5watts or less. Sometimes much less... but if an insurance or LOW PWR pelt is
requested, please be use courtesy, and avoid taking FOX time when other Hounds haven't tree'd him yet.

If you want to check up the official rules.. click on -
http://www.qrpfoxhunt.org/summer_rules.htm
and when you get a chance, say thanks to the Colorado Qrp Club for all their support!!

May the Prop Princess smile upon us all!!

Have a great hunt,

4555. PFR-3B now available from Qrpkits Dot Com

Yahoo group: pfr3_group
Date: 2015-07-31 19:27:18 UTC
From: Pacific Antenna
Topic: 4555 Message: 4555

We are happy to announce that starting today, July 31 we will have the new version of our portable field radio available through qrpkits.com.

Thanks to Steve Weber, the kit has been redesigned and now includes rotary encoder tuning.

The PFR-3B regular price will be $285 but through this weekend, it will be available at the special price of $275.

Thanks

James

The updated PFR-3B now contains a rotary encoder and other minor changes
to improve the performance.

Specifications:

Bands : 40 meters, 30 meters and 20 meters

Tuning range: Full band coverage

DDS VFO with 50 Hz slow tuning rate and 200 Hz fast tuning rate

Mode: CW only

Receiver MSD: 0.2 uV typical

Selectivity : 300 Hz

Four crystal IF filter and 600 Hz center frequency audio band pass filter

Receive current, no signal typical:

Active, 47 ma

Idle, 34 ma

Transmitter:

5 watts at 12 volts, all bands +/- 10%

Transmitter current: 650 ma (40M) to 740 ma (20M) typical at 5 watts

Spurs: - 50 dBc maximum, all bands

5 to 40 wpm internal B mode iambic keyer

Two (2) 63 character keyer memories.

Coax or balanced line output

Built in SWR indicator and BLT (balanced line tuner)

Size: 7.2" long, 4.2" wide, 1.5" high (less knob height)

Power supply voltage: 8 volts minimum, 12.5 volts maximum. 12 to 9 volts recommended

External power or internal battery pack

Have a great day,

4560. Got a pfr-3b in the mail today...

Yahoo group: pfr3_group
Date: 2015-08-08 21:47:37 UTC
From: kg5cgn@...
Topic: 4560 Message: 4560

I got my pfr-3b in the mail today and I was delighted to see that the labeling has been done. I really wasn't looking forward to dealing with the decal labeling. It was packaged nicely and everything seems to be there. Now I can't wait to start building it after I get a good soldering iron, an oscope, etc... I'm gonna do it up right for my first real build. I've built baluns, ununs, antennas, and whatnot but never a tx/rx.

4561. Re: [pfr3_group] Got a pfr-3b in the mail today...

Yahoo group: pfr3_group

From: Stephen Smith
Topic: 4560 Message: 4561

Sounds good. Congratulations on choosing the PFR-3B.

Yes, get a good, temperature-controlled soldering station and quality solder.

The PFR-3 (any revision) is a relatively complex kit. You can successfully assemble it if you avoid rushing the assembly and follow the written instructions -exactly-. In order to become familiar with the parts you'll be installing and the proceedures, read (and re-read) the innstructions before you start soldering things.

Don't work on it when you're not rested. If you feel fatigued during assembly push back from the bench and take a break. If there is something in the instructions you don't understand, don't guess the answer. Instead seek help here. You'll be glad you did.

Frankly, I don't think you'll absolutely need a 'scope for this particular kit but if you think you'll be doing a lot of troubleshooting or building gear from scratch then by all means, get one.

This advice is from someone who has previously made most of the mistakes that one can make when building (and repairing) radio things ;-).

Please keep us posted on your progress and best of luck w/ the 3B.

73.......Steve Smith WB6TNL

The paddle is no longer available and has not been for quite a long time. It was too expensive and didn't work all that well so it was quickly discontinued.

Any paddle will work, but there are none to my knowlage which will attach directly to the case of the rig.

Tim,

Go to the website of WB9LPU. He is the designer and builder of extremely good quality custom keys. He has a model for the PFR-3. His keys are not inexpensive, but they are worth every penny. I will try to attach photo of my PFR-3A with the paddle. have fun with your PFR-3. I built mine several years ago and it is my favorite radio.

Tim,

Go to the website of WB9LPU. He is the designer and builder of extremely good quality custom keys. He has a model for the PFR-3. His keys are not inexpensive, but they are worth every penny. I will try to attach photo of my PFR-3A with the paddle. have fun with your PFR-3. I built mine several years ago and it is my favorite radio.

☐

The paddle is no longer available and has not been for quite a long time. It was too expensive and didn't work all that well so it was quickly discontinued.

Any paddle will work, but there are none to my knowlage which will attach directly to the case of the rig.

Steve KD1JV

Just bought a pfr3 and am excited to put it together.

Was wondering if the paddle option is still available.

I didn't see it on the web site. Also if not available

are there any alternatives available except for the obvious like bull dog ect..

Tim

As others have shared there may not be a low cost paddle currently sold to fit onto the PFR3. How you use your PFR3 will influence whether you really 'need' such a paddle. The only read advantage to mounting a paddle on the rig is to provide 'ballast' to hold it in place -- if the paddle itself is heavy enough this need goes away. I do have a nice attachable paddle that was formerly kitted by W5JH. In your case, you might be happy with your usual paddle.

The KX1 being a bit smaller is an example of a hand-held capable CW rig. But short of a few hikers in the Pacific northwest I don't know how many of us really operate CW this way.

Enjoy your build and operating the rig.

I have an original paddle for the PFR-3..

also a bulldog style...

It'll cost about 6 to
ship.. what would one be worth?

Have a great day,

4568. PFR-3B Build

Yahoo group: pfr3_group
Date: 2015-09-22 14:58:34 UTC
From: asevenson@...
Topic: 4568 Message: 4568

Received my PFR-3B kit order placed on 9/11/15 on 9/18/15 and built over the weekend.

There are a few typos in the manual but the kit went together very well. (I don't have my notes on me so can document those minor issues later)

One of the 150pf film caps (C62) leads broke away from the cap before soldered it in to the board - I replaced with a disk 150pf cap (non-npo) - This is in the 20m bandpass filter so hoping will be ok. Otherwise, I will replace with NPO / film.

Last night I started initial testing with my 12 Volt wal-wart power supply and the bnc jack temporarily wired to the coax / gnd pads on the board. Here's my initial findings:

1) TX power at 12.1 volts seems down about 1W all bands - my QRPometer showing about 3.3-3.5 Watts out and should be 4.5-5.0 W. Checked toroids and turns all seem evenly spread - Will check turn count again but I always recount about 10 times / before soldering to board, and I _always_ check continuity.

2) Side tone and RX muting using paddle all seem fine. In straight key mode though, it seems the receiver is not getting muted and the side-tone is not great - more like a chirpy buzz? Not sure what's going on here?

3) RX seems weak on all bands with RX peaking varicon seeming to have little effect on background noise. Barely could hear W1AW on 20 when my QRO rig on same antenna heard just fine. Suspecting RX inductors L13, L14 - 40 turns just barely fit on those - I checked them several times while building but maybe I missed something.

Will be going through all my work / connections and double check everything and repost what I find.

Any suggestions / advice appreciated.

Can't wait to get it finished and try it out!

Hi Allen,
That will be a great radio, full of a lot of fun.
The issues you describe may all be related to the same fix.. poor rx, not good sidetone, low power out.. all point to tuning,
both the peak on rx.. and the power out..
Maybe the trimmers on the peaking cap... maybe the rx input coils... selected to the correct antenna port...
may get attention in the proper direction...
I have found that a turn or two more or less will bring the tx to over 6 watts out, IF all the rest is in order.. however, even then, miss-peaking or selecting the wrong antenna with the switch on the back... will bring it right down to half power and poor sidetone.

Have a great day,

A few more thoughts --

That wal wart power supply may be the cause of poor sidetone and the low transmit power. Likely when you transmit its voltage may droop a bunch, and your sidetone is what your transmit tone sounds like with this droop. Best to use a real regulated power supply (or if your wal wart is brawny enough -- then filter and regulate it).

If your receive is a lot weak, I would look for a bad solder connection somewhere in the receive chain. For example, in this project or another one -- I had a poor solder joint on one xtal. Take time to inspect carefully. Even if all looks okay, I would gently reflow the solder joints in the receiver section.

One other thing to check first! The ATU is anything but intuitive. If you are using a known 50 ohm antenna for one of the bands -- try it into the coax jack -- and try the various switch positions -- especially the toggle switch. Check the toggle switch to see which position grounds the outside of the coax connector -- this is the one you want with a coax fed antenna that is matched. This ATU by the way works fantastic on reasonable antennas -- I myself use an off-center, twin lead fed dipole for portable operating (based upon a tip posted here - somewhere around 46 feet more or less fed about 1/3rd from center should match and radiate well on all 3 bands).

You are almost there -- a good power supply and finding the source of low receive - and you should have a rig. Ask any other questions as they come to the gang here.

Hi Dale,

Thanks for the reply and advice. Note that the RX muting and side-tone seemed fine using standard 'paddle' mode. But in straight key mode (by holding DAH paddle when applying power) it seemed terrible - no other changes (that I know of) - will have to repeat the experiment again.

The rear antenna switch is not wired up yet - I'm just bench testing per the instructions at this point. The BNC connector is wired directly to the board (at the Coax and GND pads). The BFO trimmer cap is set to about mid-capacitance (1/4 turn from factory) per the notes.

I'll be rechecking everything over the next few days and hopefully find all my mistakes.

Thanks again Dale,

Allen

Happy to help Allen,
with the peaking cap midway, the antenna switch not wired in, the slide switchs become very important to
insure they don't interfere. What you have accomplished is checking that all is "in the ball park"..
It might be better to complete the radio, but with leads long enough to work it out side of mounting it.
That will allow you to "work in it" without having to
remove/reinstall/check/diangose/remove/ cycle ..
that.. is frustrating to me. So.. a bit longer leads.. and all is well.
Good Luck, feel encouraged to ask,

Have a great day,

I'm also having an issue with the RX peaking on 20M. Cap works to peak on 30 and 40, but RX just barely starts to peak for 20M when I run out of range on the capacitor. Seems I have a lot of extra capacitor movement on the 40 end (peaks way before turning limit reached) and not enough on the 20M side. How could I shift the range of the capacitor so that I can have more peaking on 20M and less wasted space after it peaks on 40 at the other end of the capacitor range? I have confirmed that there are 40 turns on both inductors. Thanks for the help!!

On the back of the tuning or peaking cap.. are two screwdriver adjustments that turn the trimmer caps, inside the cover.
They are preset to half way.. open or closed.. it may very well be better to close the trimmer.. to make the visible rotor plates cover the stator or fixed plates.. thereby making the trimmers appear to be "half moon" shape.

Have a great day,

JA

mine (original PFR3) behaves pretty much the same way, and I don't think its a problem.

to make the design simpler, the designer uses a simple LC filter for this function, and the preselect control allows the receiver to work well on 3 bands. I suggest that once your 20m setting reaches the edge of the control - the receiver is working just fine (meaning you can hear down to band noise). I am thinking on my PFR-3 the 40m setting might similarly be on the other edge, I honestly cannot remember.

Note that you can use this control ALSO as an RF gain control. if the receiver is ever swamped by big signal effects, you can adjust this control off the peak.

in short, I don't perceive you are losing any receive capability by this control reaching its limit. note the only way to change things is to adjust the inductance (less in this case) - but then you might miss this inductance on 40m.

enjoy your radiations.

Curt

Curt,
Thanks for the reply, ok I'll run it as it is for now and see how it works. It makes me feel better to know that yours runs the same. I still have to iron out some power out issues (4w 20M, 9w 30M, 4w 40M at 10.7V) but I figure that the turns need to be modified on the 30M torroids, add some turns I guess. After about 15hrs into this build I'm excited to get out and use it!! It was a good 15hrs though and I had a blast building it.

4 watts at 10.7 volts sounds just fine to me. (There is actually a formula that conveys that power is proportional to the bias voltage squared). I am concerned at you getting something like 9 watts on 30m with this same voltage. more power isn't good if it leads to smoked devices.

honestly I cannot readily identify how to get this excess power -- except for a fault in the 30m matching network -- aka low pass filter. I would re-measure the power, and if its still this high -- then check the unique components to the 30m circuit that are after the PA on the schematic -- something may have a short or not be properly connected. if this power is real, you are somehow presenting a lower impedance to the final transistors -- which isn't good for their longevity.

Yeah, I figured the 4 watts was pretty much on the money and seeing the 9 watts on 30 surprised me. I dove into it last night expecting to redo the torroids for the 30m matching network (L8 & L9 in the manual). I checked the SWR/watt meter with another radio keeping the output power the same and changed between 40 and 30 meters to see if the meter was sensitive to 30m for some reason. The meter tested out okay so I tried removing 2 turns off of L8 to see what result it would yield. This happened to put the output on 30m right at 4 watts just like I was seeing on the other bands. So I ended up with 11 turns on L8 instead of the 13 listed in the manual. I also checked through the other components which I thought were part of the 30M matching network and it looked like I had everything in it's place. Tweaking the trimmers on the RX peak capacitor helped a little with the peak on 20M so I think I have all my bugs worked out with the build!! Now to get it on the air! Thanks everyone for their help!!

it does sound like your rig is ready for some QSOs.

I confess I am surprised by the large change in output power when reducing from 13 turns to 11. Having the same power on all 3 bands is a good sign.

be patient learning how to use the internal antenna tuner. it works nice once you get the hang of it. I don't need it on 30 or 20m, but on 40m the ability to direct enter frequency with the paddle is quite useful.

Remove 2 or 3 turns from the Rx input coils and it should peak better on 20. Looks like I need to have that changed in the build instructions.

Steve KD1JV

I'm also having an issue with the RX peaking on 20M. Cap works to peak on 30 and 40, but RX just barely starts to peak for 20M when I run out of range on the capacitor.

Thanks for all the replies. I've made a contact on 40, 30, and 20 so everything seems to be working. Antenna was a 60ft end fed wire with a 20 ft counterpoise. I'm getting the hang of the tuner. The best advice in the manual is the part about if it won't tune, try moving the load knob slightly off the dimmest position and then try the tune knob again. That has worked like a charm for me. I'm loving the battery life of the rig, after a few hours of use I'm still reading nearly full voltage on the internal AAs! I'll keep it on my list to remove a few turns from the RX input torroids the next time I'm in there, but it seems to be okay for the time being. Catch ya'll on the air.

Alrighty !!! Be the FIRST one on the block to bring the news to your locals!! The Game Warden has smiled on us once again!!! This winter's season, announced by the committee:
Week 1 will be 40M on Tuesday
11/3 and 80M on Thursday 11/5. There will be no hunts the weeks of Thanksgiving, Christmas, and New Years, and we are shortening the season to 18 weeks instead of 20. I think that makes the last hunt will be March 24th.
Please Please gather your team lists, When you send that team list to N9AW, please also copy me. Thank you!!
Wy-Lee Fox

It isn't on the FOX Page yet.. but it will be there shortly.

Have a great day,

From: Dale Putnam
Topic: 4584 Message: 4584

It is time.. time to consider.. the trees turning colors... the air is crisp... temps dropping..
Soon,.. we will be looking at a white field of fluffy snow.. with little tracks across it.. soft breezes gently caressing....
the icicles.
and the FOX will be hunted!

We are less than a month away from the start.. (Nov 3. on 40m, Nov. 5 on 80m) it is time to put your apps in for FOX.. and gather up a team to have a blast while hunting.
Don't wait until the last minute.. or disappointment may prevail. The last minute flies past
quickly in the sugar rush from Halloween candy.
(and your scorekeeper gets grumpy.. and NO ONE likes a grump)
Prevention is a great thing.. especially when you can have a lotta fun doing it too!!
Check out the web page.. www.qrpfoxhunt.org
check out the QFOX QRP Foxhunts on Facebook,
and don't miss the comments on the qfox reflector mail at qfox@yahoogroups.com
Y'all come
Y'hear?

4585. PFR-3B Straight key mode problem

Yahoo group: pfr3_group
Date: 2015-10-12 16:36:10 UTC
From: jahornby@...
Topic: 4585 Message: 4585

Hello everyone,
I was using my PFR-3B this weekend and noticed a problem when using a straight key. After transmitting with the straight key, I cannot change the frequency until I either cycle the power or cycle the band mode switch. I can move the rotary encoder and the numbers change on the display but the radio doesn't QSY. Has anyone else seen this happen?

I would be happy to help you. I've built a number of the PFR3s. And have a couple on the bench now. They really don't take very long. If you are interested, ship it to me, I'll build it, calibrate, optimize, and spec it,With a warranty that it will perform at least as good as published specs. (many arebetter) And the warranty is good, unless you have tire tracks across it.Let me know,
Have a great day,

There is very little difference between the PFR-3 and PFR-3A. It was mostly a change to the circuit board layout and mostly to make the BLT toroid fit better on the board.

The most significant difference between the new PFR-3B and the old PFR-3A (which is probably what Dani is actually asking about) is the "B" version has knob tuning instead of push button. There a couple of minor circuit changes - a new audio AGC circuit and a new RX input circuit which eliminated a input coupling winding which many builders had problems understanding how to wind and properly instal onto the board. Lastly, the DDS components were moved off the main board onto a "daughter board" so that it could be more easily pre-built, tested and used in other products.

And before anyone asks, no you can not modify your old -3A for rotary tuning. Adding the encoder required making a number of changes to the wiring of the processor to free up two ports for the encoder to use.

4595. Failed Final test: Help

Yahoo group: pfr3_group
Date: 2015-11-07 14:12:35 UTC
From: jon.powell.uk@...
Topic: 4595 Message: 4595

Hi,

I've hit a problem building my PFR-3 that I hope one of this group can shed some light upon:

The build has gone fine right up to final testing of TX output (page 15 of manual)

The board powers up fine, display operates correctly, band switching tuning and RIT functions all changing the display as they should. The receiver is working on all 3 bands.

The problem occurs when I hit the key (coax connected to watt meter and dummy load). There is no RF output, display shuts down and I'm getting smoke off U7. If I turn off power and then fire the board up again display returns and all appears fine, until I key the transmitter....

I've looked over all soldered joints and all appears OK.

Can anyone offer any suggestions?

73 de Jon

If smoke is coming out of U7, you have a short to ground on one of the outputs or on the gates of the BS170's. Use an ohm meter. You may need to replace the 74AC02 now too.

Steve KD1JV

From: jon.powell.uk@...
Topic: 4595 Message: 4598

Steve, thanks for pointing me in what I think is the right direction.

Somehow I managed to install all 3 of the BS170s back to front.... quire a feat as the board has clearly screened outlines of the components

Replacements for all likely casualties about to go on order.

I'll be travelling for the next three weeks so repairs will have to await my return. I'll update on the how the build is going around the end of the month.

Thanks again

At last I got round to replacing the BS170s last night.... what a pig to get the old ones off the board!

For good measure the 74AC02 got replaced at the same time.

I now have RF output and no smoke:-)

That's the good news. Less good is that the RF output is minimal, less than 500mw. I'll be checking the LPF inductor windings in the next day or so.

I'll update after investigating.

I would REALLY like to have this radio operational for the Christmas holidays.

HI J,
It may be rewarding to check the antenna switch wiring too.
And measuring the resistance of the windings of the large toroid may help too, to prove the connections to the wire from the board.
Good Luck with it.

Have a great day,

Dale: At this stage I have my output connection is only to the BNC connector, no other connectors or switch are wired in. Board switces all in correct position.ie. set to Operate, Coax and band swithes are being set to same band in their correct pairs if you see what I mean.

Here's where I'm at using a low cost DVM, and its not looking good :-(

1. Checked voltage on mini accumulator 12.63v

2. Checked L8/10/12 and confirmed 17T/13T/14T respectively. Re spaced windings. No affect on RF output on key-down.

3. Receive current 50ma Key-down current 780ma

4. Re ran Group 1 smoke test: All 100% OK

5. Re Ran Group 3 tests (but with L7 installed)

U8 Pins 1 and 13 0v Key-up, 2.48v Key-Down

L7 pad adjacent to C57 12.01v Key-down (supply 12.63v)

Noticed Error on L7 which has 9T not the specified 8T winding.

6. Then things started going wrong... For no apparent reason display shut down.

Audio out remained active

No RF output on key-down

DDS RF output detectable.

U8 test now shows 0.01v Key up on pins 1 and 13.

Next moves:

Remove one turn from L7
Start checking all other components and windings 100%

Hopes of Christmas operation with this rig are starting to fade I fear:-(

#2 - How the turns are wound is important. You must get the turns to sit as snug as possible to the sides of the core and evenly spaced. A very loosely wound core or if all the turns are crunched close together will result in low power output.

#6 The display will blank if you haven't used any of the control switches in 10 minutes or so. Nothing else should be affected and will come back on if you push one of the switches.

The number of turns on L7 is not important, so long as there are enough of them. 9 instead of 8 isn't going to make any difference there. It's just a collector choke, not part of a frequency dependant circuit.

780 ma at 12.6V is 9.45 watts. All that power has to be going somewhere if it's not coming out the antenna jack. The most common reason for low power output is poor winding of the filter toroids or having the wrong number of turns.

Less likely possiblities are the 2N7000 QSK switch is shorted or not being turned off during transmit and power is going into the receiver front end.

If this is a PFR-3B it may not be transmitting on the right frequency if you don't have an updated processor. This was only a problem with the first small batch of kits which were shipped and everyone who needed an updated processor should have gotten one already. But it's worth checking just in case.

Then there is always the possibility it is working properly and your just not measuring the power correctly or accurately.

And of course, while your doing all this fiddling with the board, you must be very careful not to short something out and create more trouble then you had when you started.

Thanks for the fast response Steve.

Its a 3a model

LPF toroids are wound quite tightly so not much slack in them.

Thanks for the reassurance about L7, I'll leave that alone for the time being.

Yes 9+ W is going somewhere and that's worrying.

Display is no timed out. Its completely dead. No tell tale dot remains on... nothing at all. Tripping control switches makes no difference.

DDS chip is not giving off any RF now, whereas it a=was easily detectable when I ran through the checks just before the display went down.

Hoefully nothing got shorted while testing. I had the board sat atop a thick PVC cutting board so not much likelihood of any inadvertent shorting.

Checking to resume tomorrow as this evening life getting in the way of radio!

That sounds like you lost the 5V regulator at the very least. See if it's getting wicked hot and check for shorts on the bus.

Assuming you get the board to power up again you really need a scope to figure out where the power is or isn't going. If you don't have one, hopefully you can find someone local with one to help.

Bill,
  If you are not a builder consider having it built, the rig can be tricky and i read that in the info b4 purchase. I too was a bit leary only because of my skills. I did recieve a part that wasnt listed but there was a spot on the board for it. Dave, and the pfr3 group held my hand while i went for it. I was assured that if the part ruined the kit all would help with ideas to fix, fix is da key word no one wanted me to bail, if i couldnt get it going i was offered to send in for repair. Da one thing i admired most, i was gonna get THIS rig going. Wellllll turns out the part was a new one not cross refrenced, an UPGRADE hi hi the lil buggar works steller all three bands on recomended long wire es counterpoise from internet. Sum DX colorado to alaska bunch of local, take in back pack run thru outbacker gud stuff. I must say it was a great experience and i will keep 4 evr. Sorry to b so lengthy but Hendricks is top dog. Thats all i got to say bout that

Hi Bill,

I have not had any trouble at all getting in touch with QRPkits.com.. and if you have any trouble at all.. please get in touch with me..

I love their kits.. the Tribander, and all of them are great. If you are having an issue with getting a kit built.. just touch base with me..

I do that to. Or.. I will support your efforts!

Good Luck,

Dale - WC7S in Wy

I have always had very good experience with Hendricks kits.
One pot in one of my two PFR-3A kits I have purchased was faulty but received replacement as it should, fast and no questions asked.
No parts missing too in several kits purchased from them.
I have heard of customers that had problems but has not been my personal experience. For me has been very good till now. My last kit was the Scout Regen Receiver.
Fantastic kit!

Agree with all said, and if anyone has experience putting together Heathkit or Elecraft ham kit, then the PFR3 will be a piece of cake.
The radio is VERY handy considering all the built-in features:

Bill,

I had nominal build experience (a balun, an Elecraft T1 tuner, and a Rockmite 40) when I tackled the project. I have a good friend who's got a background in electronics and soldering, but he did nothing (well, he hollered at me when I was about to make a mistake). I started the build the year I got my PFR3 (2010?) and finished it in 2014--set it aside for quite some time, obviously! I asked several questions of the group, but basically I took my time and went step by step. When I was done, I shipped mine to Dale to have it bench tested, and it was right on the mark.

If you know how to do a good solder, and you are patient, you can build this rig.

Bill,

You are missing 3/4 of the fun with this radio. The only difficulty is winding the toroids correctly. I built mine three years ago and after many hundreds of Q's, mostly using a Buddipole from various challenging locations, I can say I just LOVE it. There is nothing like making contacts using a radio that you built yourself. Fear not. If you have any issues Dale can get you through them very quickly. If necessary just have Dale wind the toroids for you!

Hi Keith,
   As a senior RF engineer, I have designed and troubleshot (microwave) radios all of my professional life; not to mention as a hobby I built an HW-8 transceiver, Heath test gear, an Elecraft K1, a 35W HF Packer linear, and other assorted ham electronic goodies. So I think I've had just about all the building fun there is to be had. But I can also guarantee you that Dale is a much better solderer and kit builder than I am (considering I'm mediocre, but everyone raves about Dale's work!).

Bill, I did not persue build assistance, it was years ago that i did the build but if you put it out to the group you may get your ans. Seems like there were buiders out there with the offer. The tune up on torriods only thing i sweated but did exactly as instructions said a bit of winding spreading es collapsing (tunning) and swr can be made null, full 5 watts perfect. Gl es 73Ray kg0v

4634. Best QRP antenna for portable PFR3 use?

Yahoo group: pfr3_group
Date: 2016-02-25 01:17:48 UTC
From: billcalley@...
Topic: 4634 Message: 4634

My Google-Foo may be waning, because I did do a search in this forum and couldn't find any recommendations on the best portable antenna to take on the road with the PFR3. The antenna needs to be small and lightweight enough to fit in a briefcase with the PFR3. Any ideas? (I'm thinking a matching box end-fed antenna? Any good, low-cost antenna brands?)

Thanks,

-Bill

4635. Re: [pfr3_group] Best QRP antenna for portable PFR3 use?

Hi Bill,

I've used a balanced antenna, fed with a balanced line.. to use the BLT built into the PRF3. And edz or Dipole.. an 88ft center fed dipole

Also have used verticals, and marconi verticals.. The one that worked well without a lot of fooling with

was a windom with 300 ohm feeder line. I prefer the balanced antenna and line.. because I don't usually have time

to put in an adequate rf ground system. Unless there is one available already there.. like a broadcast station.. radial field.

Then our verticals work great!!

Good luck!

Dale - WC7S

Hi Dale,
Sounds logical to me! (Currently at my QTH I have a full length fan dipole, which works fine. Before that I had a 33ft vertical with 33 radials, which also worked fine. I'm now going to try and work on a light-weight, portable version of the fan dipole and see what happens...)
Thanks!

Bill,

With both my PFR-3A and my Mountain Topper (both Steve Webber designs) I prefer my Buddipole. Obviously the Buddipole will not fit in a briefcase. When I pack light I use the mini endfz from LNR Precision. That has given me 20M and 40M quite successfully. The mini endfz winds up into a package 6" x 2" x 2". Can't get much smaller than that. The 25 feet of coax is what takes up space. I plan to try tiny RG174 coax in the future. Of course I get the best performance using my home antennas; two dipoles and a tribander up 45 fet!

Buddistick works great, although if you read up on the QRP alias, you'll find a ton of people abandoning their Buddistick for a mag loop antenna (apparently easier to tune, lighter, etc.).

From: K2QPN@...
Topic: 4634 Message: 4640

I don't think there is a "best" antenna. It is a matter of preference and circumsatance. I use a NorCal doublet made from speaker wire. Cheap and easy. I also use a 31' end fed from KX3HELPER.COM fed with 25' of RG174 coax. Both work well. I have used them with my PFR3, ATS4 + tuner, and KX3.

There are times when it is just not practical to throw up a wire antenna. I keep looking at a magnetic loop antenna - like the AlexLoop. Pricey. Anybody have any experience with them?

Have fun.

The MAG LOOP is OK if that's all you can have but I get better results
just by tossing an end fed wire out of the top of the 4th floor window.
I built up a nice tuner for about $20.00.
At times I also use an UNUN antenna.
Common sense tells me the more wire you have up,the more capture area you
have.
I think the reason my MAG LOOP worked so well is because the RF got
coupled into the steel structure of the building.
But i'm no EE and just guessing (on the mag loop)

Subject: [pfr3_group] Best QRP antenna for portable PFR3 use?

My Google-Foo may be waning, because I did do a search in this forum and couldn't find any recommendations on the best portable antenna to take on the road with the PFR3. The antenna needs to be small and lightweight enough to fit in a briefcase with the PFR3. Any ideas? (I'm thinking a matching box end-fed antenna? Any good, low-cost antenna brands?)

Thanks,

-Bill

Keith, due to the PFR-3's Hi-Z switch and its built-in BLT, can't you lose the EndFedz's matchbox and just connect a 60' wire to the red PFR-3's terminal and a counterpoise wire to the black terminal?

Bill,
With both my PFR-3A and my Mountain Topper (both Steve Webber designs) I prefer my Buddipole. Obviously the Buddipole will not fit in a briefcase. When I pack light I use the mini endfz from LNR Precision. That has given me 20M and 40M quite successfully. The mini endfz winds up into a package 6" x 2" x 2". Can't get much smaller than that. The 25 feet of coax is what takes up space. I plan to try tiny RG174 coax in the future. Of course I get the best performance using my home antennas; two dipoles and a tribander up 45 fet!

Hi Bill, I've used a balanced antenna, fed with a balanced line.. to use the BLT built into the PRF3. And edz or Dipole.. an 88ft center fed dipole Also have used verticals, and marconi verticals.. The one that worked well without a lot of fooling withwas a windom with

300 ohm feeder line. I prefer the balanced antenna and line.. because I don't usually have timeto put in an adequate rf ground system. Unless there is one available already there.. like a broadcast station.. radial field.Then our verticals work great!!
Good luck!Dale - WC7S

Bob, maybe I'm getting the capabilities of the PFR-3 confused, but like I asked Keith; due to the PFR-3's Hi-Z switch and its built-in BLT, can't you simply lose the KX3HELPER's end-fed matchbox and just connect a 60' wire to the red PFR-3's terminal and a counterpoise wire to the black terminal? I thought that the PFR-3 could match the high impedance of an end-fed wire without any external matching...

Subject: Re: [pfr3_group] Best QRP antenna for portable PFR3 use?

  I don't think there is a "best" antenna. It is a matter of preference and circumsatance. I use a NorCal doublet made from speaker wire. Cheap and easy. I also use a 31' end fed from KX3HELPER.COM fed with 25' of RG174 coax. Both work well. I have used them with my PFR3, ATS4 + tuner, and KX3.
There are times when it is just not practical to throw up a wire antenna. I keep looking at a magnetic loop antenna - like the AlexLoop. Pricey. Anybody have any experience with them?
Have fun.
73, Bob K2QPN

I have used my PFR-3A with a 34 ft piece (10.4m) of insulated wire on a tree, with 15 ft (4.6m) insulated counterpoise wire laying on the ground. The internal PFR-3 BLT is quite touchy but you get used to it. Never fails. Have tried other portable antennas but always come back to the simplicity of the long wire. It is a small package to pack, light and works well.

Thank for clearing that up, Dale!
Yes, what got me looking again at the PFR-3 was when I found out that the new B model had come out with the rotary encoder. Now, I felt, there were no more compromises that I couldn't get over between it and my K1 -- and the PFR-3 is completely and totally portable with no muss and no fuss!

Bill,

Yes, however, I have been quite amazed as to how well that matchbox system works. I have tried the long wire with counterpoise approach, inverted vees, dipoles, the Buddipole and the endfz. Keep in mind I am just talking about antennas that I can use while out in the field in a temporary manor and hand carried. My best success had been with the Buddipole set up as a dipole. I have created charts to adjust the antenna quickly in the field rather than require the use of the internal antenna tuner. The problem, of course, is that wire antennas require trees or some other vertical support. So what I use is is dependent on where I am operating from.

Our local radio club ran Field Day as a battery powered QRP operation, no generator and no juice from the mains. For antennas we had two horizontal wire loops and my Butternut vertical (W9AB - 3B in Dec. QST) It was amazing what we were able to do with good antennas. But we did have a dozen hams to help erecting the antennas!

Keith

Bill,

With both my PFR-3A and my Mountain Topper (both Steve Webber designs) I prefer my Buddipole. Obviously the Buddipole will not fit in a briefcase. When I pack light I use the mini endfz from LNR Precision. That has given me 20M and 40M quite successfully. The mini endfz winds up into a package 6" x 2" x 2". Can't get much smaller than that. The 25 feet of coax is what takes up space. I plan to try tiny RG174 coax in the future. Of course I get the best performance using my home antennas; two dipoles and a tribander up 45 fet!

Bill,

We hams tend to put most of our dollars in the radio. I believe the antenna is more important. My next antenna will be a Hygain Hightower. I found one free last fall. All we had to do was take it down and cart it away. I will need to pour a concrete foundation, buy stainless steel hardware to replace the old rusted stuff, do some sanding and painting, erect the tower (two or three guys can do this) and add ground radials.

By the way you can make your own Buddipole dipole by using two Hamsticks. Just set it up as an off center fed dipole. My guess is that there is someone in this group who can tell you how to calculate and adjust the leg lengths.

Keith

Yes, you can match directly to a long wire. Something approching 1/2 wave is ideal, but can be significantly shorter and still find a match. However, if you get much shorter then 1/4 wave, you may not be able to match as the impedance will be too low.

End feed antennas are by far the easiest to set up, provided you have a suitable tree branch near-by.

Steve KD1JV

OK, now I'm getting a bit worried (more like a mild concern, really!), but due to the PFR-3's Hi-Z switch and its built-in BLT, can't you simply lose the external homebrew tuner and just connect a 60' wire to the red PFR-3's terminal and a counterpoise wire to the black terminal? I thought that the PFR-3 could match the high impedance of an end-fed wire without any external matching. I may be missing something here...

Subject: Re: [pfr3_group] Best QRP antenna for portable PFR3 use?

Bill,
With both my PFR-3A and my Mountain Topper (both Steve Webber designs) I prefer my Buddipole. Obviously the Buddipole will not fit in a briefcase. When I pack light I use the mini endfz from LNR Precision. That has given me 20M and 40M quite successfully. The mini endfz winds up into a package 6" x 2" x 2". Can't get much smaller than that. The 25 feet of coax is what takes up space. I plan to try tiny RG174 coax in the future. Of course I get the best performance using my home antennas; two dipoles and a tribander up 45 fet!

Subject: Re: [pfr3_group] Best QRP antenna for portable PFR3 use? Hi Dale,
Sounds logical to me! (Currently at my QTH I have a full length fan dipole, which works fine. Before that I had a 33ft vertical with 33 radials, which also worked fine. I'm now going to try and work on a light-weight, portable version of the fan dipole and see what happens...)
Thanks!
-Bill

Subject: Re: [pfr3_group] Best QRP antenna for portable PFR3 use?

Hi Bill, I've used a balanced antenna, fed with a balanced line.. to use the BLT built into the PRF3. And edz or Dipole.. an 88ft center fed dipole Also have used verticals, and marconi verticals.. The one that worked well without a lot of fooling withwas a windom with 300 ohm feeder line. I prefer the balanced antenna and line.. because I don't usually have timeto put in an adequate rf ground system. Unless there is one available already there.. like a broadcast station.. radial field.Then our verticals work great!!
Good luck!Dale - WC7S

Subject: [pfr3_group] Best QRP antenna for portable PFR3 use? My Google-Foo may be waning, because I did do a search in this forum and couldn't find any recommendations on the best portable antenna to take on the road with the PFR3. The antenna needs to be small and lightweight enough to fit in a briefcase with the PFR3. Any ideas? (I'm thinking a matching box end-fed antenna? Any good, low-cost antenna brands?)
Thanks,
-Bill

I know it doesn't exactly fit the criteria, but WA3WSJ's version of the Black Widow vertical works great for me. No tuner or sky hooks needed, set-up in less than 5 minutes. The station fits in a kid's backpack and the collapsed crappie pole doubles as a hiking stick. The bands match my first run PFR3. For me it's the Easy Button of portable antennas, and the price is right!

I've worked EU and the west coast from a second story balcony at the Jersey shore. The West Coast station was a young ham on 20m running a Tuna tin xmtr with a Radio Shack rx. Fun stuff.

Thanks for the answer, Steve! Then I figure on having a 70' end-fed (placed vertically when possible) wire and three or four 20' radials (so people don't break their necks with a single, longer radial). I work only 40 and 20 Meters, so this should be pretty ideal, I would think.

Subject: Re: [pfr3_group] Best QRP antenna for portable PFR3 use?

☐Yes, you can match directly to a long wire. Something approching 1/2 wave is ideal, but can be significantly shorter and still find a match. However, if you get much shorter then 1/4 wave, you may not be able to match as the impedance will be too low. End feed antennas are by far the easiest to set up, provided you have a suitable tree branch near-by.
Steve KD1JV
OK, now I'm getting a bit worried (more like a mild concern, really!), but due to the PFR-3's Hi-Z switch and its built-in BLT, can't you simply lose the external homebrew tuner and just connect a 60' wire to the red PFR-3's terminal and a counterpoise wire to the black terminal? I thought that the PFR-3 could match the high impedance of an end-fed wire without any external matching. I may be missing something here...

Thanks Bill, it picked me I didn't pick it since it's an issued call. Still waiting on Power Ball or Mega Millions though, hi.

I found the coil to be any easy build, though I did use very small tapping screws into the PVC coil form to hold the straps on, aided by a good amount of JB Weld epoxy. I did do some filing of the intrusive tips with some epoxy over that. Also did the coating Ed describes but I don't think it's needed.

I forgot to mention that the short piece of PVC tube to elevate the mast and subsequently the feed point is important. Don't go by the pic of the guy on the beach, there should be about two feet of tube it should be sitting on. It must fit several inches into the bottom of the mast so some kind of stop must be wrapped around the tube. I used a small piece of foam over wrapped with electrical tape.

I've bungied it to picnic tables where I couldn't even drive a tent peg in and to wooden railings. Like I said, easy. Good Luck if you try it. Maybe you will hear Ed from the Appalachian trail with his.

I could have used a couple of pieces of wire. I already had the end fed so I used it. I was at Disney World's Grand Floridian hotel on the fifth floor. I tied the match box the the balcony with the coax and dangled the wire over the edge. I was on the air.

Wow some of these answers did not address the question at all ! I wonder if some of these folk are running for president?

Someone on the list once suggested an off-center fed dipole. Length not that critical but I did a half wave for 30m, maybe 47 or so feet fed at 1/3rd point. Nice radiator for all three bands. the antenna is quite compact, trick is finding small enough balanced line - but 300 ohm twin lead works as it is what I used here.

of course my answer is biased by being in places with trees to hold this antenna up. also I used it once from a high rise apartment with a sunroom.

Curt,

I was considering buying another PFR3 - but somebody said one of the presidential candidates promised to give free radios to any needy hams - to be paid for by a tax on radio equipment manufacturers... True?

Anyway, I agree with Curt on the short OCF antenna and the feedline can just be a loose twisted pair. Steve Weber's built-in ATU handles that FB. Of course his PFR3 tuner handles all kinds of antennas: my PFR3 hasn't met a wire it didn't like, if you follow Steve's advice and make sure it has sufficient length.

In my opinion, the fun of it all is going outside with a spool of wire and experimenting. Someone on this tread said they were going to get a KD1JV-PFR3. Now is a perfect time to put one together - for warm weather fun!

Lynn I would be a little more careful selecting rf feedline than a twisted pair. If the motivation were only to get a little signal to the end it would work. Folk hsve used ac lamp cord, but I have seen some rather high loss measured for this. You can imagine this loss is in the dielectric with all this field concentrated on it. I suggest using twin lead if you can get some.

Sure the pfr3 is a great field radio for those of us content with a few bands and aren't carrying it many miles.

Curt,

Thanks, sounds good!

I am using that loop antenna with the simple feeder and a $3.50 CW transceiver kit I got from Shenzen, Guandong province China: It puts out 800mW at 12V. Here is the most recent QSO with that loop and the little rig - filtered audio for your listening enjoyment!
https://youtu.be/LoBsF0Jo8uw

The unfiltered (honest) demo is here:
https://youtu.be/LoBsF0Jo8uw

If anyone is really interested, here are all the videos on a playlist that includes slides of the build and a nice recording of the PIXIE that Carl/WB0CFF made on his Orion:
https://www.youtube.com/watch?v=oNu0kqH5Jnw&list=PLFiIJJI5T2wfSfddvYLS84k7x97pj-we8

So much fun, for so little money.

You can get a kit for $3.59 with free economy shipping here
http://www.ebay.com/itm/DIY-RADIO-40M-CW-Shortwave-Transmitter-QRP-Pixie-Kit-Receiver-7-023-7-026MHz/321745589972?_trksid=p2141725.c100338.m3726&_trkparms=aid%3D222007%26algo%3DSIC.MBE%26ao%3D1%26asc%3D20141212152715%26meid%3Dfc5bc277094c442fbdf1ae1984af381a%26pid%3D100338%26rk%3D1%26rkt%3D28%26mehot%3Dpp%26sd%3D171805763798

Or spend a few bucks more on Amazon, I ordered one on Amazon for 6.95 including shipping - and they sent me two instead!

But, I know PFR3, and the Pixie is no PFR3!

Hi Don,

You have the sizing just about right... the photo tells it all..

the BLT tuner with swr bridge that is built into the PFR3 is what is the extra size.

What tuner you need with the other rig.. is up for grabs.. as it would be when carrying both radio and tuner.

Have a great day,

Announcing:
FOXTRAVAGANZA!

The Winter 2015-2016 FOXTRAVAGANZA will take place on Thursday, April 7th, 2016. All 40 and 80 Meter Foxes, Alternates, and the QRP Foxhunt Committee can call CQ FOX on either 40 or 80 Meters. How many can you work? There will be no official scoring, just feel free to brag (or complain) on the QFOX List<https://groups.yahoo.com/neo/groups/qfox/info> or Facebook<https://www.facebook.com/groups/219719414724171/>!

4677. Convert PFR-3's QSK to PTT?

Yahoo group: pfr3_group
Date: 2016-04-07 05:19:23 UTC
From: billcalley@...
Topic: 4677 Message: 4677

I really hate fast QSK. Always have. And with the PFR-3, during high QRM and QRN periods, I can't hear the sidetone, so I have to manually turn down the volume anyway, so an added "PTT" toggle switch would make things much easier for me.

How can I accomplish this? If there is no way, then can I at least add a QSK delay for about half a second or so?

Thanks!!

-Cotter (KZ3J)

How can I accomplish this? If there is no way, then can I at least add a QSK delay for about half a second or so?

Thanks!!

-Cotter (KZ3J)

4679. Re: [pfr3_group] Convert PFR-3's QSK to PTT?

Yahoo group: pfr3_group

Topic: 4677 Message: 4679

The simplest way would be to wire a toggle switch to short the wiper of the volume control to ground. Side tone is injected directly into the audio amp via it's second input so that is not affected.

Changing the QSK timing would involve modifying the firmware for the processor.
Steve KD1JV
I really hate fast QSK. Always have. And with the PFR-3, during high QRM and QRN periods, I can't hear the sidetone, so I have to manually turn down the volume anyway, so an added "PTT" toggle switch would make things much easier for me.

How can I accomplish this? If there is no way, then can I at least add a QSK delay for about half a second or so?

Thanks!!

Thanks Steve and Dale! Wow, a response from both the designer and the builder of my rig; fantastic! Both ideas are great, but I think I will go with Steve's method, since a toggle switch is how I converted most of my older QSK radios. (BTW guys, I have completely replaced my beloved K1 with the PFR-3 as my home (and field) radio. Picture enclosed).

Thanks again!

4681. RIT not working on new PFR-3 build??

Yahoo group: pfr3_group
Date: 2016-04-08 07:11:14 UTC
From: billcalley@...
Topic: 4681 Message: 4681

Dear Gentlemen,

I am running my brand new PFR-3 through its paces, and I noticed that when I tried to use the RIT during a 40M QSO tonight, that not only did RIT not change the tone of the off-frequency sender, but also when I moved the tuning knob up (in RIT mode) it actually muted the RX! The only way I got the RX back in operation, oddly, was to press the TX key by sending out a single dit. Any ideas guys?

Many thanks,

-Cotter

That is odd, have no idea how that could happen. Check for solder shorts or opens around the processor socket. I double checked the operation and it works fine as far as the firmware is concerned.

Hi Steve,
  Thanks for the response. I checked, and I don't see any solder bridges at or around the MPU. Just a thought: can I replace the MPU with any ATMEGA48, or does it have on-board firmware that must be present? (In that case, I could hopefully buy the U4 part from QRPKITS.com).

It has to be programmed with the approperate firmware, a chip you buy from a distrubuter is blank. If everthing else works properly, I have a hard time believing that one function would not work as it should.

If the display segment test stays on for 8 seconds and there is no sidetone, then the processor needs to be replaced as the clock fuse bit was not set. But if you have sidetone and the segment test is 1 sec long, then you have a good chip.

Steve

Hi Steve,
  Yes, the segment test is as it should be and I do have sidetone.
  This morning I took out the PCB, scrubbed it to remove any slight residual rosin and any possible solder shards, and inspected the entire top and bottom of the board with a magnifying glass. Still no joy in finding a solder bridge or a bad/unsoldered joint.
   I'm at a loss if it's not the MPU.

Best,

-Cotter

Steve, another ultra weird thing I just noticed with my PFR-3B that I should have noticed before (but it may be intermittent), is that I can feed the PFR with a single tone from a sig gen (or hear an on-air QSO) , and then tune the PFR +/- 2KHz, and the CW tone does not change in pitch nor volume, nor does it drop out of the crystal filter's bandpass until I reach the +/- 2KHz edges -- and then the CW sig drops out like a stone (but the pitch NEVER changes). What the hell??

-Cotter (KZ3J)

Hi Dale,

...and as I said before, Murphy never loses: I just found out that qrpkits.com never sent out the processor. Looks like they forgot to. Wonderful. But please don't forget about me; I might get a processor from them eventually, but I'll probably still need your troubleshooting expertise because the PFR-3 will most likely still not work after the swap! (Yes, Murphy never sleeps).

Hi Guys,

I read the PFR-3 manual on calibration, but I'm still not quite sure how to adjust the audio filter's bandpass to center it on 600Hz (the side tone's frequency). As you can see by the screenshot, the RX filtering is a bit too high. I don't want to futz up a good build, but I'm kind of OCD about this kind of thing...

Thanks,

-Bill

Bill

Its been a while, but I am thinking there msy be an adjustment on a crystal oscillator in the receive chain. The transmit to receive offset is encoded into the controller IC along with the pitch. If this bfo is off, yes the signal will be offset as you suggest. Scan the board for presence of a trimmer cap and an alignment step. If this isn't it the experts will be by here again.

Dale,

"Remember, each time calibration is entered.. the 10mhz osc must be calibrated also."

Crap, I didn't pick up on that at all when I read the Calibration procedure. Thanks! (But how many people have a calibrated 10MHz OCXO handy? Thank goodness I do, but it's gotta be rare). Also, while I do have an O'scope or two around, wouldn't all adjustments be possible (and easier) by simply using an audio spectrum analyzer placed at the headphone output, so that the audio passband and it's frequencies will be readily visible? (I may be missing something obvious, since I have been out of the RF design biz for quite a few years).

Best,

-Bill

Hi Bill,

In a way, you somewhat answered your own question. The folks that have all the equipment and knowhow, don't generally follow the instructions to the exact letter. They and you, of course, may choose to use the other methods that are available. The audio filter.. in the pfr3 centered in the passband per the instructions will put the tx offset to the freq that the filter is set to. Due to the "steps" of the osc being digital, the rx peak and tx freq could possible be off center by about a 100 hertz. That's plenty close enough to make a QSO today.

The spectrascope will work great too, as will an O'scope, to prove the filter is functional, and either can be used to align the radio, no problem. But bring your own instructions. [☐]

Dale, I think I nailed it. I performed all of the Cal routines from page 11 with the new MPU processor (which, I hope, stores the Cal data in FLASH?), so not only do I now have a centered passband, but the TX output is now within 10Hz of the display (thank you HP Freq Counter!). Very awesome for an HF radio, at least in my experience with the HF rigs I have owned through-out the years. (I know time marches on, but this is damn good for a $300 field radio!)

I just wish the PDF manual had two or three different Cal routines: One for those with basic (O'scope, DMM) to no test equipment (which is what is now in the manual), up to those with the typically ham owned RF Freg Counter, Audio/RF Spectrum Analyzer, and RF sig gen (sig gen to confirm RX freq when not in Cal mode).

Also, most modern hams now also have an "Antenna Analyzer", which works perfectly as a single port VNA or SNA for tweaking HF filter passbands (when you terminate one port with a 50 ohm load).
Best,
-Bill
PS: It seems I misread page 11, as I did not need my 10.000.000MHz calibrated OCXO at all. Well, at least it was warmed up and ready to go!

Hi Bill,

I like the idea of having both routines,.. don't know if both could be put into the manual or not..

How about you write one up, share with me, and I will be more than happy to share with any that ask, and

give you credit?

Have a great day,
--... ...-- Dale - WC7S in Wy

[Attachment(s) from Bill Cally included below]

Dale, I think I nailed it. I performed all of the Cal routines from page 11 with the new MPU processor (which, I hope, stores the Cal data in FLASH?), so not only do I now have a centered passband, but the TX output is now within 10Hz of the display (thank you HP Freq Counter!). Very awesome for an HF radio, at least in my experience with the HF rigs I have owned through-out the years. (I know time marches on, but this is damn good for a $300 field radio!)

I just wish the PDF manual had two or three different Cal routines: One for those with basic (O'scope, DMM) to no test equipment (which is what is now in the manual), up to those with the typically ham owned RF Freg Counter, Audio/RF Spectrum Analyzer, and RF sig gen (sig gen to confirm RX freq when not in Cal mode).

Also, most modern hams now also have an "Antenna Analyzer", which works perfectly as a single port VNA or SNA for tweaking HF filter passbands (when you terminate one port with a 50 ohm load).

Best,

-Bill
PS: It seems I misread page 11, as I did not need my 10.000.000MHz calibrated OCXO at all. Well, at least it was warmed up and ready to go!

I'll look into that Dale, but since I'm not familiar enough with its processor or internals, I as a known ex-technical writer really hesitate to write about Cal'ing the PFR3. For me, too many unknowns.

Thanks,

-Bill

Hello to the group.
Just programed a new atmega48pa with the new firmware PFR3a_b.hex, but seem to have problem with very slow action on boot up, band changes and tuning. Could it be that the clock fuse in the atmega should be set to 8 mhz clock. The factory default is devided by 8 and wonder if that could be my problem. Used an stk200 compatible and did not recieve any errors after flashing. Would greatly appreciate some assistance, OR source of programmed chip.
Otherwise the PFR3 is working great with the old chip, except for the frequency hop.
Thanks very much, Tom VE3KZJ

Hello, Tom
Did you program the chip yourself? ?If so, did you set the fuse bits or leave them in their initial state?
I programmed several of these and have not had a problem, but I made sure the fuses were set properly.

Let me know if you need additional info. ? I will probably have to dust some cobwebs out of my brain to remember all of the programming details.

regards... Harlan ,K6BS

Thanks for the quick response Harlan. I did go and read up on setting the fuse for the CKDIV8, and changed that. All works well now. Did not think of that till after posting my question and also sent out an email to Steve KD1JV - asking for his help. Have sent an explanatory email to Steve, with thanks.
I'm amazed what happens inside our brain when it becomes necessary to explain a problem to others. It seems to turn our own internal gears.
Thanks to you for adjusting and posting the HEX file, that's what I used, cause I'm still too green to know much about programming myself.
Cheers to all Tom VE3KZJ.

Hi All,

Built my PFR-3B somewhat recently and sent to Dale for final check out and alignment, (Thanks again Dale). Finally had a chance this weekend to try it while camping somewhat near Mt. Rainier National Park. I used the new to me, SOTAbeams Band Hopper 20, 30, 40m dipole up about 5M.
While I heard a few signals I could not make a contact though to be fair, I mainly was trying 40M in the morning and still learning how to use the BL tuner.

So today I hooked up the rig to the home antenna, a Cuscraft R-8 Vertical, and started searching. Band condx weren't great but at 0137 I answered KR6E, Ben in CA and was rewarded with a solid 569.

First one is in the log!

73,
Allen, AE7TG

Way to go Allen,

It is a fun rig.. for sure.. maybe we can do a 3-2-3-Q one day.

(PFR3 to PFR3 Qso)

The tuner does take a bit to get used to.. but it works on almost any antenna.

just dim the led.. don't have to make it go out.

Good rig = good fun!!

Have a great day,

Thanks All,

Many Qs to come for me and the PFR. Have 3 in the log now; CA, OR, and a NPOTA station in WY I snagged yesterday.

I just have to remember to switch back to Operate after tuning. I think I called for about 5 min at one point with the switch in Tune position.

Somewhat off topic quick question - I'm using the Amazon basics Ni-Mh batteries (the black ones) similar to Eneloops I think.

At what voltage should I remove and charge them for maximum life/efficiency?

I'm thinking at around 9.6V total for the 8-pack in the PFR. I didn't check when starting but I was getting close to 4-watts out at 10.1V as measured by an analog QRP wattmeter.

Thanks again and I'll be looking for more QSOs this evening.

Way to go!

I have been using my PFR-3 for 6 years at home, traveling and camping. Using the rig's internal tuner, you can set up a simple wire vertical or inverted L and counterpoise and work the world - it has an excellent, selective RX. Working QRP DX from a campsite is near the top of my list for fun things to do: my first expedition camping on a beach with my PFR3, I worked ZL, JA, UA0 and OH from my comfy op position under a tarp next to a campfire on the WA coast. see:
https://flic.kr/s/aHskxJdh8f

The rig is small enough to carry while traveling -I have had fun times working from DX locations in EU and SA with it. All you need is a small key, the internal batteries, some magnet wire and earbuds and you are in business. All of the above fits nicely into a small Pelican 1150 case.

You are in for some fun operating.enjoy!

I have the honor of being your first fox of the summer season. I'll also be the fox for the last hunt of the season.
I have not even listened to 20M this summer so I have no idea what to expect for conditions.

I will be transmitting somewhere between 14050 and 14070 KHz on Thursday evening June 30th at 21:00 - 22:30 EDT.
I am located in Newton NH about 50 miles north of Boston MA and about 10 miles inland.
My rig is a K3 set at 5 watts. The antenna is a 3 element beam at 70 feet which I will move between NW and S.

If you are new to the foxhunt the rules are on the website
www.qrpfoxhunt.org<http://www.qrpfoxhunt.org>
QRP Fox Hunt Home Page<http://www.qrpfoxhunt.org/>

I will be your other Fox for the 2016 Summer Hunt season.

I will be operating from Mar Vista, CA. 3 miles East of Venice Beach. Rig will be my K3 at 5W and the antenna will be swinging around to find all you hounds. Look for me between 14.050 and 14.070 starting at 0100Z. Key is set for 22-23 WPM. Send to me at your comfortable speed and I will adjust. Oh, yes, I will be sending up at the beginning of the hunt. Spread out 1-3 Khz.

Just a reminder. The exchange is RST, state or Provence,name and power. 559,CA, Don, 5w. There might be a few instances of dead air or auto CQ's while I blow my nose. (Don't ask!)

Have fun.

Good luck and happy hunting.

I am having problems with testing my radio, this is the second one I have built, I did not have any issues with the first "A" Model.

I can't remember how I did the Zero beat with WWV for the DDS calibration.
I remember doing it though.

It says to zero beat it, but where do I hear the signal??
When I =go into Cal r mode I con't hear anything, how can I zero beat it ??
And when I go into CALo mode I don't see any waveform on the scope.

Bummed out.
Thanks,
Chuck

Topic: 4718 Message: 4719

The easiest way is to pick off a bit of signal from TP1. I usually do that with a short (about 6 inch) lead, while the rx is tuned to 10mhz WWV. Zero beat on the rx.. by adjusting up or down on the PFR3

good luck,

Have a great day,

Go directly with QRPKits.
They have all so are parts you need for your PFR and customer service has been extremely good with me.

Topic: 4726 Message: 4727

Sometimes they will send the same color of wires and not green or red as was my case when I built the PFR-3A.
But the smaller the number the thicker the wire is. #26 is thicker than #28.
Hope to have understood your question and hope this helps.

A veces van a enviar el mismo color de los cables y no verdes o rojos como era mi caso cuando construí el PFR-3A.
Pero cuanto menor sea el número más grueso es el alambre es. # 26 es más grueso que el # 28.
Espero haber entendido su pregunta y espero que esto ayude.

From: Luis LU4HK
Topic: 4731 Message: 4731

Hello everyone
I just received my first PFR 3 B and could not be wound toroids is wrong and possibly the diameter of the magnetic cable.
The T37-2 toroids where I roll up 40 laps I have no space, missing about 10 laps or so.
I see if the local market get cable coil motors of 0.32 mm and the BLT seems a very fine wire 0.40 mm.
I will appreciate if someone had this problem and I comment on it.
Also if there is any support for equipment calibration does not possess oscilloscope or other measuring instruments.

HI Luis,

The large wire.. would be what is used for the large toroid, for the BLT tuner..

The smallest wire is what is used for L13 and L14.

The middle sized wire is used for T2.

The tuneup can be very easily done with a vom.. or even by ear.

Listening to the output of the rx,.. during tuning the rx bfo, and tuning the passband. The 10mhz osc.. would best be done with another rx on 10mhz.

Good Luck,

Have a great day,

When I built my PFR-3B last month, I had a similar problem. The wire supplied with my PFR-3B was all the same size and when measured with a micrometer it was .016 inches. .4mm, or 26 gauge same as Luis measured. This would not be a problem except with L13 and 14. I knew it looked too big for 28. I happened to have a wire assortment from Dan's Small Parts that included enough 28 gauge enameled wire to wind the 2 inductors. It was a toroid full with 28 gauge, 40 turns of #26 would never have fit. My 28 guage wire measured .013 +/- or .32mm.

I'm not faulting qrpkits.com, it would be easy to mistake the 2 gauges of wire.

Hi Luis,

I'm sure James at qrpkits.com will be glad to send you enough of the proper size wire to wind L13 and L14. I had no trouble using #28 wire on the 2 coils. All others I wound with the #26 and my rig is working fine.

73,

Rick

The Balanced Line Tuner.. is designed to work on Balanced Lines... with the antenna switch in the BLT position.. that works WITHOUT anything connected to the coax bnc. IF a coax ant is connected to the coax bnc, and NOTHING connected to the BL connectors.. then the blt tuner will tune the coax line.

and of course put the coax-blt switch on the front panel in the correct position.

good Luck

Topic: 4216 Message: 4744

Greetings!

The 2016-2017 Winter Fox Hunts start this coming Tuesday. Everyone is welcome to participate, and we can still use a few more qualified Foxes.

This is one of the premier events that CQC sponsors, and it gets us a lot of attention across the country, so please support it! Participate as a Hound, and if you feel up to the task of being Fox don't hesitate to put in an application at http://www.qrpfoxhunt.org

Each Tuesday (40M) and Thursday (80M) there will be two Foxes available-- catch them if you can. It's easy (sometimes) and fun (always) and great training for busting a DX pileup and or handling one if you are the Fox. The Hunts start at 0100Z and run for an hour and a half. All the details can be found at http://www.qrpfoxhunt.org Check out the rules, and bookmark the home page because that's your gateway to the schedule and the results as the season progresses.

The QRP Fox Hunts are also at home on Yahoo Groups at

https://groups.yahoo.com/neo/groups/qfox and even on Facebook:
https://www.facebook.com/groups/219719414724171/

or search for QRP Fox Hunt. Both groups are public, so come on in and join us.

Have a great day,

I am selling an assembled PFR-3B, the latest version with the encoder, for a friend who is no longer able to operate. He built the PFR-3B in June 2016 but was never able to use it. I've checked it out and it is putting out between 4 - 5W from the built-in AA battery holder on all 3 bands. The TBS-1 battery status LED is installed but not connected and the black plastic button on the TBS-1 switch is missing. He installed a Hammond tilt bale on the rear that will raise the rig to a convenient view angle when engaged. Although the rig seems to be working perfectly the receiver may need to be aligned as he was not able to finish the alignment procedure.

This rig is like new with no scratches or blemishes that I can see. Price is $275 postpaid to the continental US. Alaska, Hawaii and international postage will be extra.

Paypal only. Reply off list if interested.

73,

Rick W4DST

From: beargyrils@...
Topic: 4747 Message: 4747

I remember when Dale built up my PFR-3 when the kit first came out
One final for each band and from a 12 SLA battery it put out a full 7 watts
Can someone send me a picture of the latest FR-3 rig?
Thanks
BOB AF2DX

Doc

Dale here knows these rigs inside and out. I have the original version - here is what I think --

The microcontroller IC in the rig is set up specifically to handle either the push buttons or the knob -- but not both. KD1JV himself could recount how easy it is to swap ICs to enable knob tuning ....

Then you need to acquire the rotary encoder to tune using this method -- and drill a hole for it.

Whether it is as easy as having a new IC, a new part, and a new cover -- I cannot answer.

As for your motor skills -- I have you tried using an object to press the button - such as a pencil eraser? Forgive me for thinking outside the box -- as I can't relate exactly - just trying to suggest.

I hope you are still enjoying RF somehow! The activity is 'good' in spite of the challenge.

Curt

Hi Curt,

I think I missed the original question. I do think that someone is trying to consider trying to put the encoder into an early version PFR3.. not to be critical Curt.. yet to put it bluntly, that won't work out as well as you'd think.

There are changes to the board, the freq standard, and the obvious changes include the encoder. IF you want an encoder on a PFR3, I would strongly recommend that a quick contact to Pac Ant to place an order would be in order.. IF you can't see yourself building another one.. have them send it to me, and I'll build it. Or have one of my team build it. DO NOT try to add an encoder without a whole lot of forethought and detective work. It just isn't as simple as swapping the processor and adding an encoder.

ALtho. you have an alternative, now.. that can work well for you.

Thank you Curt, for the heads up..

Have a great day,

Sorry Doc, it is simply not possible to do so. I had to move around the connections to the processor chip to free up ports for the encoder to use so either the board would need a lot of cuts and jumps to rewire it or the frimware would have to be seriously modified, or both. It would be a lot of work. There there are also mechancial issues to deal with.

Hi Doc,

What I am saying is that adding an encoder to an older version radio would best be accomplished by taking the old radio out of the case, carefully poking an hole in the lid of the old case.. buying the new kit radio, building it and installing it into the old case. To try to accomplish adding the encoder to the old radio.. is not feasible. IF you want a new radio.. then I'll build it if you don't want/can't.. that part is really easy.

From: Dale Putnam
Topic: 4757 Message: 4757

The 80 acre FOXHUNT will start promptly at 7pm MT Thursday evening, aka 0200z Fri, between the two trees marked 3550 and 3570.. Between those two trees will be TWO FOX, aka K4BAI and WC7S who will be calling "CQ FOX de (cal)" "UP" or "DWN"

This is a training for dx ops that want to become more proficient working through dx pileups, so listen close to the FOX instructions.. it isn't out of line to hear "up 1" then the next time "up 2" and then "dwn 1" ... all of which indicate where to go to grab a pelt freely handed out by the FOX. This also indicates what the FOX may be having to deal with too. A HUGE pile of baying hounds.. all in a pile is tuff to sort out, so moving about, may help, when following directions, or spreading just abit out of the pile.

The exchange will be - RST- state/province - name - power (max power is 5 watts, while many have gained a pelt with under 100 mw across the country)

K4BAI Ga John 5w

WC7S WyLee 5W

Good luck to all, and

May the PROPS be always in OUR FAVOR

Have a great day,

4759. add small amplifier to pfr3-a

Yahoo group: pfr3_group
Date: 2017-01-08 16:52:33 UTC
From: michaelg0hio@...
Topic: 4759 Message: 4759

Can anyone advise how I can connect my pfr3a to a small amplifier, like the popular ones on ebay -MX-P50M.
The Mini hfpa kit is rf switched and would be ideal but costs towards £400 to my door in the UK!
I have found a few simple circuits to switch the amplifier but have no clue where to connect to the pfr3a.
I participate in Summits on the Air and have never failed to get contacts with 5 watts, but the number of contacts is reducing dramatically as the sunspots decline. The antenna was considered first and is about as good as a portable antenna can be. So this is why I wanted to add a bit more power in the 2017 season.
Any help would be appreciated.

(I wrongly posted this as a file and cannot delete it, Sorry)
Thanks Mike

So, you need a way to control the T/R relay in the external amp. I would use the MUTE control line from the processor. You can identify which pin it is from the schematic. You need to buffer that port to use it externally. A 2N7000 will do the trick and will provide an active low output to turn on a relay. Drill a hole in the back of the cabinet and install a jack of some kind to route that control line out to the amplifier.

Steve KD1JV

The tuning is very sharp and it can be hard to see the dip in the LED. Running the rig at reduced voltage to reduce the power output might help.

Try using a different load resistor. Maybe it doesn’t like 375 ohms. Although the tuner can match a wide range of loads, we never figured out exactly what the upper and lower limits are.

You might need to spread out the turns on the toroid a little. Count the turns to make sure an extra turn or two wasn’t added.

Steve, KD1JV

Enjoy your fine rig acquisition. One more thing on the antenna - please note there are 2 switches involved with its use. Note the toggle switch on the back -- take out your DVM to appreciate how it works. In one position, this switch will attach one of the banana terminals to ground - this is the position normally used with a coax cable attached to the rig. the other position disconnects ground, and is used with balanced line. the other switch is a high-low impedance switch, which may come in handy for some circumstances.

I suspect not everyone mounted the toggle switch in the same direction - you may wish to label the grounded position.

as Steve suggests it is a sharp tuner, and I find them a bit harder to adjust than a normal C-L-C tuner. but it is a nice tuner - so have some patience. someone on the list had suggested a 46 foot long off-center fed dipole (fed at 1/3rd point) fed with balanced line -- and I have used it on all 3 bands with the PFR3 from a cabin.

once you understand the switches -- time to try an antenna ! use any atmospheric noise to pre-position the tuner adjustments.

73 Curt

Thanks for the help. I discovered that C70 wasn't soldered on one of its leads but that didn't fix it. I suspect the coil may be the problem. I found that to get the LED to go out on 40m the tune control is at around 75% and on 30m it is around 90%. Maybe that means there is too much inductance in T3 to get resonance on 20m. Its hard to count the turns on T3 while it is soldered in place but it does appear there may be at least one extra turn. Removing T3 and rewinding it seems kinda daunting but maybe I'll have to do that.

Steve, just a thought. Instead of dismantling the radio to rewind T3, would it be a good idea to short out 1 or 2 turns on the top of the toroid on each side of the center tap?

I tried adjusting the trimmers on the tune and load varicaps but I still couldn't bring 20m into range so it looks like inductance is the issue.

I would not be quick to put the rig into surgery. What kind of antenna are you trying to tune ?

Did you try both low Z and high Z settings of the top panel switch ?

Are you sure you have the toggle switch I mentioned in the appropriate position ?

Try to tune the antenna in the receive mode -- just listening to noise -- to see if you can find a peak.

One extra turn does not entirely phase me that it is worth disassembly, until you are sure you have tried all these settings.

I take it you have only one antenna to try ?

Unless you are anxious to use the rig on 20m, I would suggest using it some on the other 2 bands - -experience may help with the solution.

Curt

Topic: 984 Message: 4770

Thanks Curt. Yes, I am familiar with the antenna switch on the back. Before posting my question I read quite a lot of the previous posts on the topic. I am confident that I have BOTH switches in the correct positions. I have tried various antennas and when I experienced difficulty with all of them I followed the advice I read on this group somewhere, and tried tuning a dummy load. I am using 4 parallel 1500 ohm, 5%,1W resistors connected to the balanced line terminals. With this arrangement I can make the LED go out completely on 40m and 30m. I am familiar and comfortable with the very careful, interactive adjustment of the two tuning controls. I believe that too much inductance is my problem because the "Tune" control is way up on 40m, and just about max on 30m, suggesting 20m is just out of range. I can convince myself there is a very slight dimming of the LED on 20m if I fiddle with it long enough. However, that probably means my SWR is still too high.

BTW: This is a 2008 model of the PFR3 that I bought used from a retiring ham.

From: va3kot@...
Topic: 984 Message: 4772

After much poking and prodding of the T3 windings and some adjustment of the trimmers on the Tune varicap my BLT now seem to be able to tune all three bands when connected to my home QTH antenna (147ft long wire up 50ft terminated in a 1:1 current balun and a short coax). I wish I knew what finally made it work but I don't. My T3 may have been too close to the switches above it and caused a short. I finally got it to work when I prised the core up a bit to examine the windings so just maybe ...

Anyway, thanks for all the help guys. Appreciated.

From: va3kot@...
Topic: 4774 Message: 4774

I am still new to this radio and learning its tricks. I managed to program the two stored messages but now the radio spontaneously transmits one of the messages (usually the first one) while I am keying. I understand that when I want to send a stored message I hit the menu button then one of the two paddles. That works just fine. I have checked battery voltage - not a problem. I suspected maybe RFI from my dummy load. That doesn't seem likely as the dummy load is inside a metal can. Has anybody else experienced this, or can anybody suggest a possible cause?

I am begininng to suspect this is not an active group any more so I'll document my experiences trying to use the PFR-3 stored messages function for anybody who may share the same problems.

Two difficulties have been experienced:
1. Stored messages (in my case, my CQ message) transmit spontaneously while I am keying. It doesn't matter whether I am using paddles or a straight key, transmission of my stored CQ message begins unexpectedly and unpredictably, interrupting a QSO.

2. As others have documented here, stored messages are sometimes corrupted during transmission. I suspected the problem was due to my keying error during programming at first. However, most of the time, the messages are sent just fine.

Regrettably, these two problems - especially the first one - make the Hendricks PFR-3 keyer messages unusable for me. I am looking into external keyer alternatives and will erase the stored messages as soon as I have a solution. I am disappointed because I bought my (secondhand) PFR-3 with high expectations and a great deal of excitement for a one-box solution for operating in the field. It is possible that my unit has a problem that others don't have but I have no way to determine that since my original post (and a previous post on another topic) received no responses.

Yes, this is not a very active group, but I do monitor it in case a question like yours comes up. Sorry I've been very busy the last few days so didn't have a chance to respond immediately.

It sounds like a software glitch, but to my knowledge, you're the first the have a sporadic sending problem. If you have a very early release of the kit, there was an interrupt problem which if it occurred at the wrong time could corrupt the entering of a message, but it did not cause a random sending of a message. This was a fairly rare event since several things had to line up at the same time to cause the glitch. Which made it a real bugger to debug.

There is only two possibilities. One is the KEYER switch is intermittently closing while your sending and that is activating the send message routine. If the switch toggle lever seems real loose and wobbly, that might be the problem. The other is the processor program memory has lost a bit or two corrupting that part of the program, though that is a long shot. Usually if something happens to the processor, nothing will work right.

I would investigate the switch as the potentual problem first. Worse comes to worse, we can send you a new processor, but we'd need to know which version of the kit you have. To find out, you'd have to remove the board from the case to see the top side. If in the lower left corner it says "REV A" you have a REV A board. If not you have an initial release board. The only difference as far as the processor is concerned is two the LED segments got moved around to different ports.

73, Stev3e KD1JV

Welcome to the QRP FOX HUNT! Home Page "It's a fine fox chase, my boys!" George Washington, Battle of Princeton, 1777

for the rules.. the exchange will be RST, State, Name, Pwr ..

To honor one of our members will be missed, K9JWV (SK) recently, many of us will be using "JIM" in the exchange. How many "JIM"s can you find?

Please post your log on the qfox reflector, that will be our only scores for this final FOXTRAVAGANZA.. of the season. COME Have some fun with us.!!

Have a great day,

From: Dale Putnam
Topic: 4778 Message: 4779

The NAQCC Sprint will be on tonight also.. with the FOXTRAVAGANZA..
The NAQCC exchange is RST STATE PWR or #
The FOXHUNT exchange is RST STATE NAME PWR

For the FOXHUNT FOX, HOUNDS, and Committee, who will be working each other.. all for all.. in order to share with the NAQCC and help everyone have a great time.. let's work them too.. I happen to have an NAQCC number.. and will make my exchange:

RST WY JIM nr 272 5w IF you don't have a number.. just send your power.
The only catch may be in getting their name.. and in that case.. from an NAQCC member, it would be real easy to log in the name as NAQCC..

that covers the needed info.. for the FOXHUNT.. and for the NAQCC..

Now, for the NAQCC.. they have scoring to worry about..
FOXHUNT folks will not.. so the more we work.. the happier we get. And.. the more fun for all.

ALSO ---
because we will have many more stations in the woods than normal.. let's expand to utilize ALL that we can. In other words.. BIGGER WOODS. IF you find a clear spot below 7.030.. go for it.. or above 7.050.. spread out to ease the pressure a bit..

Let's all have fun..
GOOD LUCK!! See you in the wider woods

Have a great day,
--... ...-- Dale - WC7S in Wy

Luis

I am not understanding your receive problem exactly.

First, please note the 2 configurations for the internal antenna tuner, via toggle switch in the back. This ATU works nicely, but is complex to use.

Not sure what you mean hy noise with the antenna connector pulled? perhaps you may be be saying you hear noise with no antenna connected? If so, this is not a big problem if band noise via the antenna is louder.

Do evaluate all 3 bands.

Also insure you are using a good power supply. a computer type power supply may be too noisy.

I do not anticipate noise problems inside the PFR3, as the DDS and controller should not contribute noise without a serious assembly problem, like a backwards capacitor or missing one.

Curt

PS my daughter speaks Spanish if you have difficulty describing the issue and wish to email me, see qrz.com

Luis,

We need a lot more information about what might be working to figure out what isn’t working.

Problems with soldering are by far the most common reason a kit will not work. In my experience of looking at many kits sent back to me to fix, it is the only reason. Inspect all the soldering very carefully. Usually it’s only one or two places which cause the problem. The trick is to narrow down the area to look at.

Were you able to calibrate the DDS and adjust the BFO trimmer? Does it transmit with proper power output? Do you hear side tone when keying the transmitter? Display works and tunes up and down?

Do you have all the switches in the correct positions?

Steve KD1JV

Luis

Still awaiting my translator she seems to be occupied. If your pfr3 was working, possibly your repair damaged a weak solder joint. As there are few parts do examine the complete receive path.

I am not sure what you mean by magnetic cable, unless you refer to coaxial cable. Do check with a DVM to make sure you do not have a short circuit across a coxial cable or other RF connection.

We all have simple problems in circuit assembly. its a very nice rig so be patient.

Luis

do continue to evaluate - as maybe things are okay now. use your DVM ohm-meter to set up a direct path to the coax connector - to evaluate receive and transmit.

I have had both solder issues (at one of the crystals) and issues as you describe with the coax cables.

I sense you are almost there - enjoy the journey even in difficulty.

No word from either of my translators - but maybe you are almost finished.

Curt

4791. 12 volt 7amp reading 18 volts

From: Pacific Antenna
Topic: 4791 Message: 4792

Is the battery lead acid or some type of lithium? The latter can often have higher voltage.

If it is lead acid, that may be the open circuit voltage since a multimeter will not provide any load on the battery.

Try putting a resistor across the terminals while measuring the voltage.

Something in the range of 200-500 ohms should give enough load. You can always parallel larger value resistors such as 1K ohms to get to 500.

If it is much above 12.6V under load, it could cause damage to the PFR.

One easy trick is a few in line diodes. With the diodes, you just need ones with sufficient current capability (3 or 4A) and put several in series in the power lead. Each one will drop about 0.7V so you can just determine how many are needed to get to the desired voltage.

Please let me know what you find on the battery as that voltage should not be seen with a typical lead acid battery.

Attachments: 1 described; binary payloads are missing from this source WARC

If it is truly reading 18V, something is wrong with it. The nominal under charge voltage should not much exceed 13.8V. It can only go higher if a cell develops a high internal resistance and an unregulated charger is being used. In that case, in use the battery will loose voltage quickly due to that bad cell or cells. I have several gel cell batteries which need to go to the recycle place.

It is also possible, but unlikely your voltmeter is way off.

Steve KD1JV

Hi Kurt,
Does the radio work ok now? or is it still in trouble on the blt side?
If so.. when in the blt mode, in tune.. does the led dim at all.. while tuning the Load and Tune caps, with the low/high switch in either position and the antenna switch in the balanced position.. with a 600 ohm resistor across the terminals.. it should be a 5 watt size.

Is anyone aware of a small gap requirement between the board and the bottom of the crystal case?

I'm building my PFR-3B now and on other rigs, they've called for like a 1/16" gap between the board and the case. I don't see any specs in the manual but thought I would ask.

Thanks for any help,

Brent

Actually, there is no need to space the xtal, the pads are smaller then the insulator around the lead. They will not short out if pushed flush to the board and that is how I build them.
Steve KD1JV

Thanks Dale, I'm glad I checked first... sounds familiar.

I've already installed the xtals with a 1/16" max clearance and the cases are grounded. So as long as this won't be detrimental to the efficiency, maybe I'll leave well enough alone given the pain it would be to adjust.
Thanks for the input Steve; so lucky to be able to receive advice from you.
Brent

Looking for some advice....
I have the above ceramic disc capacitors soldered on to the board. Looking ahead, it would appear to me as though these capacitors are too tall to allow the top lid to fit properly... The top of these capacitors sits approximately 1/4" above the LED display.
Anyone else run across this same issue? Suggestions?
Thanks,
Brent

Those caps, need to have straight legs to be inserted low enough to clear. I can't tell but suspect that the caps all have the little bends in each leg, holding them off the board. They need to be removed, legs straightened, and reinserted, to allow them to sit low enough.

Have a great day,

One of the concerns when straightening the legs is to NOT let them twist or roll.. I've found that by holding the soldered end, (in your case).. and using needle nose pliers to straighten the legs.. all without holding the cap itself.. will usually let the let be straightened without twisting.

Good Luck.. and remember to be gentle with the amount of heat applied to the board. Lifted pads are a source of trouble later.

So far so good I think Dale. I'm going across the board and re-installing any that are going to cause a problem. I'll take your advice about not twisting and to be careful about lifting any pads.

C12, C14 and C43 are film (.01ufd) caps that can still be lowered a little but not enough to stand upright when the lid is on. Are they okay to be gently bent on an angle to allow closure of the lid?

Hi James,

I have no doubt that you will do that James, thanks very much.

I've been on the board here and getting advice as I thought perhaps I might have installed these caps incorrectly, thus making them sit too high on the board.... that could very well be too.
I've seen pics of other builds and it looked like the caps in those builds were much smaller (not so tall).

I sent you a pic a few minutes ago with a description of the problem....thanks

73
John

Yes, the tab (shiny side) is the heat sink and is usually installed against the surface it is attached to.

Please follow the manual under "Entering Calibration Modes"..

and understand that the rx filter is set to one side of the tx.. so you may hear the tone. Attention to the peak found will ascertain the correct alignment, to allow transceive operation.

4832. DDS module installation / 8 pin header strip

Yahoo group: pfr3_group
Date: 2017-10-07 21:51:39 UTC
From: transistors56@...
Topic: 4832 Message: 4832

Does the DDS module and header strip get installed so that the bottom of the module is almost 1/8" off the board? Solder the strip in place first, trim leads and then solder on the module....?

Thanks,
Brent

Yes, I have, in some cases put a little rubber foot under it.. to take a bit of stress off of it. But that is overkill, in most cases.

4843. Tx output and Rx impressions

Yahoo group: pfr3_group
Date: 2017-10-08 14:01:31 UTC
From: transistors56@...
Topic: 4843 Message: 4843

I didn't go to bed last night until after 2am.....this little beauty came to life around midnight and I couldn't quit playing!

Using a dummy load and a OHR WM-2 watt-meter and a power supply of 10.25 volts, my tx output is:
20m - 0.5w
30m - 0.75w
40m - 1.75

These initial outputs are kind of low, right? Where should I start to bring these outputs up some, or should I wait until I do some field tests with antennas and I've swapped out the replacement components Pacific Antenna has in the mail for me? I'm assuming the L6, L8 and L10 coils will need some tweaking?

With regards to the receive.....I must say, this little gem really shines. Using my Icom 7300 as a reference, the receive seems to me to be "spot on". Very quiet receive..... As I type this, I'm sitting here listening to F5IN calling CQ in a contest on 20m; using my Zero Five 43' ground mounted vertical with 25 radials.

Hi Brent
Way to go!! Good job! Now to tweak the filters as you suspect. Rather than rewind each one. Just unwind one turn tack the long lead back on temp to see if that improves power out. If not then rewear the wire back on. You didn’t say what the input voltage was. With 9 v the 40 m is sorta close.
You are getting mighty close to done. Isn’t it a blast to use?

Make this a great day

4846. Load capacitor doesn't seem to function

Yahoo group: pfr3_group
Date: 2017-10-08 22:05:44 UTC
From: Todd Christell
Topic: 4846 Message: 4846

Greetings:

Well I've been a lurker since I got my license two years ago. I purchased and built the pfr3 as my first radio to act as an inspiration to learn Morse. I built the radio which had a couple of problems and never pursued the Morse.

So I'm finally working on learning code and I've resurrected the radio. Found a couple of issues and, except for somewhat low output power (12 volts going into their QRP 50 ohm load is giving me about 9 volts) seem to have an issue with the load capacitor.

I can tune into 40 and 30 meters without a problem. 20 meters dims the LED at the far range of travel, but the weird thing is that all my tuning is with the "Tune" capacitor. The "Load" capacitor has absolutely no effect. Checked my solder joints and they seem good.

Ideas?

Thanks in advance and 73

Todd AD0RR

Not knowing what antenna you are using I wonder if the impedance switch may help. Another thought is the adjustment on the caps may need addressed by turning the trimmers. If you want to send it I would be happy to optimize it and run a spec sheet on it.
Make this a great day
Dale

Using a dummy load and a OHR WM-2 watt-meter and a power supply of 10.25 volts, my tx output is:
20m - 0.5w
30m - 0.75w
40m - 1.75

These initial outputs are kind of low, right? Where should I start to bring these outputs up some, or should I wait until I do some field tests with antennas and I've swapped out the replacement components Pacific Antenna has in the mail for me? I'm assuming the L6, L8 and L10 coils will need some tweaking?

With regards to the receive.....I must say, this little gem really shines. Using my Icom 7300 as a reference, the receive seems to me to be "spot on". Very quiet receive..... As I type this, I'm sitting here listening to F5IN calling CQ in a contest on 20m; using my Zero Five 43' ground mounted vertical with 25 radials.

73,
Brent VA3YG

If the aluminum is solid rod then the tuning will be affected by finger capacitances. That would be the plastic is used with lock washers.

Make this a great day

Thanks for the reply Dale:

I've got a 6 band Hustler vertical with 1200' of radials. I tuned it with my antenna analyzer and all bands are under 2:1. My Yaesu FTDX-1200 tunes into it without any problem. I saw the trimmer caps on the back of the main cap but was afraid to dink. It's just weird that the variable has absolutely zero effect.

How much for the tuneup and spec?

Shipping In a small flat rate Usps that’s about ten bucks. It might also have one poor solder joint. On one winding of the torpid in the tuner

Make this a great day

From: transistors56@...
Topic: 4843 Message: 4855

When I first finished building the rig and testing output, here's what I found at 10.25 volts:
20m- 0.5 watts
30m- 0.75 watts
40m- 1.75 watts

I got some good advice on here and some of that included removing one turn and re-testing. When I started to do this, I noticed some pretty shabby soldering of the leads.

I de-soldered L6, L8 and L10 to fix what appeared to be crappy soldering done by me during the build. When I started with L10 and de-soldered the first lead, the coil fell off the board. I hadn't even heated the other lead yet..... So, obviously they all needed to be re-soldered, and that's what I did. Removed the three coils, clean up the leads, tinned them properly and re-installed.

I left all the leads the same length as before.

Here are the tx outputs today at 12 volts:
20m - 1.3 watts
30m- 1.95 watts
40m- 3.0 watts

Todays readings at 10.25 volts are:
20m- 1.0 watts
30m- 1.5 watts
40m- 2.5 watts

Anybody got any thoughts? Perhaps I should now remove a turn from each of L6, L8 and L10 Dale?

Thanks,
Brent

Yep, you have corrected, apparently, what seems to be the Muphy in each build that has a problem. The

second issue is that the toroid cores seem to change a bit.. or the snugness of the windings are different.. what ever

causes it, the inductance measures a bit different from coil to coil.. so.. to optimize the tx..

start by just removing one turn, don't cut it off, just tack it back down.. with the extra lead intact... and check the power out..

adjust the windings on the two cores.. see if the power comes up some.. if it does.. take another turn off.. do it all over again..

yes.. the lead is VERY LONG by now.. so it will reach to the right spot. When the power drops.. put a single turn back on.. and cut the lead, tin the remaining.. and reinstall the lead. Then go to the other one. Same thing.. finish that band.. do the two remaining bands..

REMEMBER.. this is on COAX.. no tuner.. and a KNOWN GOOD 50 ohm load.

no problem, ..

I have not found a PFR3 yet.. that doesn't make 5 watts out on all bands, yes.. sometimes it takes a bit of coaxing.. but it will do it.

and like it too... ☐

Prior to putting it on the bench until I work on it again tomorrow, I fooled with the spacing of the 30 and 20m coils. The 40m coils already are spaced optimally by the looks of it.

At 12 volts, here's what I was able to tweak out...:

20m- 1.7 watts

30m- 3.8 watts

Look at the jump on 30 meters! Almost doubled.....just by adjusting spacing

73,

Brent

That's great Dale, thanks for the thorough instructions.

When you say "adjust the windings on the two cores", what two cores are you referring to?

Subject: Re: [pfr3_group] Tx output and Rx impressions

When I first finished building the rig and testing output, here's what I found at 10.25 volts:
20m- 0.5 watts
30m- 0.75 watts
40m- 1.75 watts

I got some good advice on here and some of that included removing one turn and re-testing. When I started to do this, I noticed some pretty shabby soldering of the leads.

I de-soldered L6, L8 and L10 to fix what appeared to be crappy soldering done by me during the build.
When I started with L10 and de-soldered the first lead, the coil fell off the board. I hadn't even heated the other lead yet..... So, obviously they all needed to be re-soldered, and that's what I did. Removed the three coils, clean up the leads, tinned them properly and re-installed.

I left all the leads the same length as before.

Here are the tx outputs today at 12 volts:
20m - 1.3 watts
30m- 1.95 watts
40m- 3.0 watts

Todays readings at 10.25 volts are:
20m- 1.0 watts
30m- 1.5 watts
40m- 2.5 watts

Anybody got any thoughts? Perhaps I should now remove a turn from each of L6, L8 and L10 Dale?

Thanks,
Brent

Good evening....

An update on my PFR-3B build tx output.

I temporarily removed one turn from coil L10 only.

At 12 volts, the tx output is now:
20m- 3.0 watts
30m- 4.0 watts
40m-3.0 watts

Taking one turn off L10 has affected both 20 meters and 30 meters!

Happy dance.....

Brent

I've seen a request to keep this on the reflector.. and since we are near to wrapping it.. maybe we can.

To lower the power.. correctly.. or with an eye to final efficiency and protection, if you can monitor the tx current, while adjusting the spacing and watching the wattmeter. (yep.. multi handed, multi eyes).. you should be able to lower the power to 5watts and see a noticeable drop in currrent. Mis-adjusting the spacing can result in lower power and very little reduction in current.. and that is not going to end well for the "Mr. Finals Club".

Always keep the current below 1000 ma keyed. IF you measure total current supplied.. you have a tiny margin for the finals.

And, because the PFR-3 has a built in tuner, with load, and Tayloe swr bridge.. it won't see wildly swinging swr while TUNING...

however if the antenna goes to presenting wildly swinging swr, the finals do see it, and that.. leads to a very short life for them.

You've heard it.. antenna flapping in the wind.. and suddenly the tx doesn't... with the PFR-3.. when the antenna starts swinging.. switch in the "tune" position.. for very cheap insurance for the finals.. watch the swr led.. see if it changes a lot in brightness. IF it does.. leave tune on.. and finish up. IF NOT.. go back to "OP"

You're there, Brent.. have a great time with it.

Maybe one day we can do a P2P Q.... (PFR3 to PFR3 Qso)

Subject: Re: TX output PFR-3B

OK!! Now you got it!!

I have done that.. trying to improve one band while adjusting the "other" band filter.. yepper.. got the shirt too... ☐

If you can, make a note of the voltage and current on each band.. but be careful about how long you have it key down..

and allow it to cool between tests. With it over 5.. care about length of keying and into what.. will have an effect on life of finals.

Subject: TX output PFR-3B

In thinking back, I don't think there was any interaction between the bands. I haven't really noticed it since. In fact, I've looked for it.....and it doesn't appear to happen. I think I might have played with the 30 meter coil when working on the 20 meter coil and forgot about it.

After some more tweaking, here's what I've got:

11.96 volts into an OHR WM2 wattmeter with a nice 50 ohm dummy load

20m 5+ watts

30m 5 watts

40m 6.75 watts

How does that look Dale?

Brent

Dale, Bob AF2DX, is interested in my findings, so here I am back on the reflector.

Here are the latest tx outputs:

12 volts and using a 50 ohm dummy load.

20m 5 (and a wee bit) watts
30m same as 20m
40m 6.75 watts

11 volts with a 50 ohm dummy load
20m 5.0 watts
30m 5.0 watts
40m 6.0 watts

10 volts and dummy load
20m 4.5 watts
30m 4.5 watts
40m 5.0 watts

Okay Dale, just read your response back to me after I sent results of some further testing...thanks

The grandkids are coming in an hour or so, so I had better get upstairs and get ready. Thanks for the help and I will pick up on it later today or maybe tonight....

I follow your comments about current. Another question.....would it be feasible to limit my power supply to 10/10.5 volts max? Would that offer some protection?

Also, do I understand the operation of this rig that the tuner is only available for the balanced line outputs, not the coax?

73,
Brent

Depending on the plans for use.. you may want to leave it this way... and use a 9v battery as a source.

The 9v battery allows a very respectable signal, and is light to carry.. and it is such a kick to use the

PFR-3 for a 12 hour contest, or over a weekend in the wild, .. and do it with a 9v battery.

That's exactly what I was thinking Dale!

This won't be my main QRP rig; but to use something I built with a little 9 volt battery would be a hoot...

Thanks again for all your help, I appreciate it.

Actually the tuner works in both, coax or BLT. The coax-balanced line switch selects the feedline.

The tune-op switch works for the tx/rx any time.

Okay Dale, just read your response back to me after I sent results of some further testing...thanks

The grandkids are coming in an hour or so, so I had better get upstairs and get ready. Thanks for the help and I will pick up on it later today or maybe tonight....

I follow your comments about current. Another question.....would it be feasible to limit my power supply to 10/10.5 volts max? Would that offer some protection?

Also, do I understand the operation of this rig that the tuner is only available for the balanced line outputs, not the coax?

73,
Brent

Well, I've got it all buttoned up and am sitting here listening to N3RD on the PAQP call CQ. I returned his call and he replied back first call with a RST 529. Not bad with a set of run down AA batteries; the antenna is a 43' multi band Zero Five vertical with 25 radials.

Also got my first spot on the reverse beacon network; NC7J Utah Contest Club on 7.028.

Building this little beauty is the most fun I've had in amateur radio for a while. Can't wait to take it portable and use the BLT tuner with some EFW antennas, etc.

Very nice Luis; thanks for sharing those pics. I also use Buddisticks and have had great luck with them. These days I'm kind of in to end fed wires and simple antennas fed with ladder line. I'm looking forward to using my PFR-3B in the field.

How long have you used your rig?

Brent,I have used the end fed wire for about 7 years now and had nothing but excellent results with them. Cheap and very simple but pulls in stations. I also use the UN-end fed but it needs the counter poise for each band. I use the 65 foot wire and a short piece hooked to the rig. Search out AA5tB. He has an excellent site on the end fed. Good luck and Glad you have the PFR rig perking away. 72 Bob AF2DX

Well, I've got it all buttoned up and am sitting here listening to N3RD on the PAQP call CQ. I returned his call and he replied back first call with a RST 529. Not bad with a set of run down AA batteries; the antenna is a 43' multi band Zero Five vertical with 25 radials.

Also got my first spot on the reverse beacon network; NC7J Utah Contest Club on 7.028.

Building this little beauty is the most fun I've had in amateur radio for a while. Can't wait to take it portable and use the BLT tuner with some EFW antennas, etc.

Hi Brent, the tuner for an end fed is very easy to build. 1 core and one poly cap and it's good for 8 watts with no problem
I know the PFR rig has a tuner built in but it is nice to have the extra. tuner for other QRP rigs
Have fun with the yellow rig. 72/73 BOB AF2DX

Brent,I have used the end fed wire for about 7 years now and had nothing but excellent results with them. Cheap and very simple but pulls in stations. I also use the UN-end fed but it needs the counter poise for each band. I use the 65 foot wire and a short piece hooked to the rig. Search out AA5tB. He has an excellent site on the end fed. Good luck and Glad you have the PFR rig perking away. 72 Bob AF2DX

I've just recently developed a scratchy sounding receive. This may have appeared after I worked on the coils to tweak the power output.

You can hear this if the RX PEAK or volume knob is rotated. You can hear an amplified tap sound and this scratchy sound when I tap on any of the knobs. If the rig is jiggled a wee bit, this scratchy receive sound is very evident.

After playing around a little, I notice that I can make the scratchy sound totally disappear by gently pulling up on the RX PEAK knob. If I maintain a gentle upward force on the RX PEAK knob, there is no scratchy receive when any of the knobs are rotated or when the knobs are gently tapped.

I'm very suspicious about the RX PEAK knob. This one seems to be the one that can affects the noise. If I gently pull up on it and maintain that upward pressure, I can't make the scratchy noise happen. I'll take the lid off and reheat the solder connections , first for the RX PEAK knob.

Thanks Bob. I'll be back later.....

Hi Brent,

using a plastic, non metallic small tool, tap gently around the vol control, on the board, very gently.. if you can localize the sound by taping.. then reflow the components in that area. Even if the current connection looks good.

Hi Dale,
I just reflowed the solder on the bottom side of the RX PEAK, volume, Load and Tune knobs and was able to avoid any plastic (not like me hi). With the bottom lid secured tight, there's no more scratchy sounds and things are quiet as a mouse when I tap any knobs or switches.

Thanks to Bob and yourself for the advice.

I'm going to be back at a later date to go over this BLT and stuff. I'm having a time with it. Probably making it more difficult than what it actually is.

I connected a 42' wire on to the red binding post and no counterpoise, flicked the toggle switch to face the coax fitting, switched to tune and made sure the switch was on BLT. No way could I get the swr LED to budge from a bright red. I used this length of wire after having watched a Youtube video where the amateur had success with his PFR-3 and this length of radiator.

Brent

Most anything classic fed with ladder line or twin lead, such as the 88 foot doublet. It will even do somewhat unbalanced. Someone here had described an off center fed cut for 30m, around 46 feet, fed at one third. It will load nicely on all three bands. Its in my travel bag. For a fixed station I might prefer the longer center fed.

The BLT will trim coax too, but then I suggest something not too far off match. My 160m top loaded vertical contains a 29 foot section that loads nicely on all warc bands thru coax, since its swr is lower than 3 to 1 on each.

Curt

Thanks for sharing your experiences Curt; it's nice to hear. I'm especially looking forward to playing with ladder line, etc. and made note of the 88' doublet.

Messed something up on my build to do with the BLT. Dale was so patient and worked with me step by step to try and find the problem. I took him up on his offer to spec the rig out. Feel relieved that it will come back working properly in all aspects.

I did use the rig with my ground mounted vertical via coax and also some portable operation and was very successful with some contacts.

I learned so much working on this build and through emailing Dale. Fun build...

I've saved your email and have put it in my PFR-3B file.

Thanks es 72 de Brent VA3YG

Using the BLT takes some practice. The adjustments can be very sharp and interactive. Often you need to tune past the dip slightly on the TUNE and re-dip with the Load, working back and forth until you get the LED to go out. But even if you can’t get the LED to go out all the way, the SWR will be acceptably low if you get pretty dim. Seeing the initial dip is usually the hard part. Peaking for best signal strength or band noise first usually gets you close.

It’s a good idea to practice with a dummy load of some kind. For the balance line, H-Z position, a 4.7K, 3 watt resistor is a good load to practice with. Or just a 50 ohm in the Low -Z position. Once you find the settings for each band, you can mark the positions on the case. Then it usually only takes minor adjustments from those positions for any load.

You do have to remember to have the toggle switch on the back of the cabinet in the correct position. If your using the direct coax connection, make sure your not connected to the BLT or you will back feed it.

73, Steve KD1JV

Kind of like the ZM-2 ATU I built a couple years ago. That took a great deal of patience/practice as well.
I'm set up here for a 50 ohm load so I'll use the Low Z position for practice. It'll all come with time; in the meantime it's been a lot of fun and quite educational as well.
Yes on the correct position for the toggle switch.....must remember
Thanks Steve.

HI Steve,

Which model of PFR-3 is it? The voltage measurement at L5, will tell us if the finals are seeing keyed voltage.

IF the voltage is being keyed, then drive to the finals may be missing.. or.. the finals may have been toasted.

The testing should be done into a dummy load, of coarse, and a precheck of the antenna switch to insure it matches the

manual is in order too.

An rf probe will help with the drive check.. or a voltage check on U7.

They are pretty much a tank, takes a beating an keeps on ticking.. until the sand melts, after a real problem.

Have a great day,

Since your hearing signals, all the switches must be in the correct positions and the path through the LPF is okay. In this case, the most likely problem is the PA choke has broken loose from the board and the PA is not getting power.

Steve KD1JV
Recently acquired a PFR3 in a trade ...it came from a SK estate via 3rd party so I know little about it's former life? Receiver is working well with loud signals on all bands! Keyer/sidetone are also playing well just no output into a dummy load or 50-ohm antenna. Adjacent receiver hears a weak carrier S5-7 but no keying just a solid carrier which stops when I stoping keying? So any tips where to look or test points I can probe? Sorry no scope here only a DVM ...didn't notice a troubleshooting section in the documentation or maybe I missed it? Any help is much appreciated!

73, Steve/wGOAT

steve yo use fldigi, connect audio prf3 cable to pc input. connect prf3 in calibration mode and move the tuning until you find the 700 hz on the screen (waterfall) and you're done. me works properly centered. 73 LUis LU4HK

Tks,Steve! …trying to track down where to test L7 (is L7 the PA Choke?) ...since parts layout says it’s top side and I think I’ve isolated the pads on bottom side

…BUT while searching I noticed the ant/switch is looking like it’s wired up funny PLUS when I switch back and forth from BLT to COAX I’m still hearing signal there’s no difference like the switch is shorted?? (FYI antenna is 4BTV and hooked to BNC jack via 100’ of coax) …should RX go quiet when I switch to BLT? ...since I've no ant hook to binding post? …ok for sake of testing I’m gonna undo the wiring on the switch and just go direct from S8 switch in other words direct from LP filters to BNC and see what happens? ...More soon! Steve

OK ...once I got the crazy wiring job on the coax/BLT switch outa the way I could see the cut trace going to L7 What the? ...see pic

Why would someone need to do this ...they even marked it with the black arrow ...go figure Maybe they just wanted to RX with no chance of TXing? So about to solder bridge the cut trace and see if we get any RF ...but need to check addendum notes maybe this was suppose to be cut? I would find that hard to believe? Steve

No shorts measured at silly cut trace ...so I jumpered it and BINGO! I've nice power out on 20/40m but nothing on 30m now? Hmm?

How much power is hard to say on my homebrew watt meter maybe 2-3W via a 9vdc battery for testing purposes! Wanted to limit the current so using a half dead 9vdc. (8.5V?)

Little steps at a time! ...Next figuring out what is awry in the 30m path? Could it be the LP-filter coils?

Steve

From: goathiker@...
Topic: 4910 Message: 4924

More progress ...Hah! We make FIRE (RF)! Reheated all the pads in the 30m LP path and now 30m has power out! Yaah!

Also realized I've working with a original partial manual (had no page #s) just downloaded the 26-pager from files for PFR3a! And looks like there's some other fixes (jumpers) that need to add. Kinda felt like I was dealing half a deck!

Also the note in files says something about the first 100 kits had a programming error? My MCU has a very faint red line on it but no red dot ...does this mean I need to send it back to Steve for rezapping??

So far this has been a fun learning project makes me realize I need some better tools if I'm going to continue with debugging my kits! RFmeter, QRP dummy load etc

Steve wGOAT

I don’t remember what the bug might have been. If there is one it might show up pretty quick.

Oh yea, it was an interrupt which if it occurred at the wrong time when entering a message for the keyer memory, would mess up that character and send some garbage. It doesn’t happen all the time, so took a while for anyone to notice and longer to find.

Steve KD1JV

Thanks all for help!

Mystery continues ...Still trying to figure out which manual matches my radio? My PCB is labeled: REV A 2/09/08

The PFR-3A
Three band “Portable Field Ready”
QRP CW Transceiver 40/30/20 meters
Hendricks Kits – www.qrpkits.com KD1JV Designs
11/16/09 updated 3/1/10

Or this one (I'm thinking this one below)

The PFR-3
Three band “Portable Field Ready” QRP CW Transceiver
40/30/20 meters
Hendricks Kits – www.qrpkits.com
KD1JV Designs
Production manual 6/10/08
Rev B.2 September 22, 2008

Both manuals speak about adding a jumper mod on the MCU my PCB has none?

Thanks, Steve/wGOAT

Anyone have recommendations on AA-battery chemistry, charging, etc
I kind of leary and don't trust batteries mounted inside with delicate electronics but that said if you're removing them on regular basis then maybe less worries about leakage ...and remove them for prolong storage.

So is it alkaline, NM, or are other better options?

Thanks again for the guidance, Steve/wGOAT!

This guy sells them: http://www.amateurradioproducts.com/

I bought one. You can indeed use it as a paddle. You can bend it to adjust the feel. I thought it was adequate for the price, but would never be a "go-to" portable paddle for me. I wanted a paddle for SOTA, and if you throw this in the pack, you have to re-bend/adjust it on summit, and I didn't want to have to carry needle nose pliers.

I have been using K9LU's paddles from www.amateurradioproducts.com for the past 2+ years every day at QTH -- it is my only paddles, and they are superb. I can send up to 50WPM on them (I'm QRQ OP as well as QRS ;) -- when they first arrived I underestimated them, but once stuck to the desk with the included "chewing gum" tack, UFB. I've also used them /M in the car, stuck to the door rest, and dashboard. If you don't want to make them, they're definitely worth the $30 to buy them ready made.

4942. BLT Question?

Yahoo group: pfr3_group
Date: 2017-11-02 19:17:31 UTC
From: goathiker@...
Topic: 4942 Message: 4942

Folks, My question is the BLT in the PFR3 a different or modified design than the ZM2 or Norcal version for a reason?

Here's what I found on the web for the ZM2 BLT and similar Norcal BLT
Primary: 16T w/CT

Secondaries: 12T for highZ and 6T for low-Z

However in the PFR3 its:
Primary: 11T w/CT @ 5.5T

Secondaries: 6T for highZ and 2T for low-Z

My PFR3's BLT doesn't seem to work (not dimming LED) no matter if it's in L or H Z positions and coax or balanced positions ...to 50-ohm antenna or random wire.

And since I didn't build this kit I decided for debugging purposes to remove T3 just to make sure it was properly wound ...seems it is IF the windings above are correct?

My goal is to be able to primarily match end fed wires of various lengths (29' 35' 41' or 58') using a counterpoise with PFR3's BLT. Matching a CFZ or OCF balanced antennas aren't planned so much.

SO my question is winding info correct? Are others finding the PFR3's BLT to be working for EF wires with good results?

Thanks again for your guidance, 73 Steve/wGOAT

Does anyone have the measurements for T3 in uH? Such as: 12T = (?) uH, 6T = (?) uH, 2T = (?) uH

Thanks, Steve/wGOAT

4944. Re: [pfr3_group] BLT Question?

Yahoo group: pfr3_group

From: Steven Weber
Topic: 4942 Message: 4944

The turns specified for the BLT is different from the Norcal version because the turns for the Norcal version will not tune to 20M. At least not with the caps and core supplied with the PFR. The winding information is correct.

For the 10,000th time, the tunng of the BLT is very sharp. The two controls are interactive. Your best bet is to practice with a dummy load to find the settings. Once you find the settings, they don't change a whole lot regardless of load, so you can mark them on the panel. I'm not sure of the exact span of loads it can match, but it's pretty broad. I've tried all kinds of random lengths and have matched them all. The LOW-Z setting only works for loads around 50 ohms.

1) set the Load to mid scale.
2) adjust the Tune to peak band noise or signals
3) Disconnect the antenna and hook up your dummy load. If testing the balanced, HI-Z, a 4700 ohm 2-3 watt resistor is good.
4) VERY SLOWLY re-adjust the Tune control untill you see the LED dim, even just a little.
5)Adjust the LOAD to make the LED dim some more.
6)Adjust the TUNE again, but a little bit past when the LED dims. You may have to go up or down and you won't know which way is better until you readjust the LOAD to see if you can make it better or not.
7)Repeat 5 and 6 as many times as needed to make the LED to go out or become very dim.

Folks, My question is the BLT in the PFR3 a different or modified design than the ZM2 or Norcal version for a reason?

Here's what I found on the web for the ZM2 BLT and similar Norcal BLT

Primary: 16T w/CT

Subject: [pfr3_group] PFR-3B for sale

Sadly, I'm offering for sale my new Hendricks PFR-3B transceiver.

I purchased it within the last couple of months and had a lot of fun putting it together..

It now seems to have a transmit problem. It receives great...but does NOT transmit. The transceiver is being offered for sale as not working.

It was operating beautifully and was putting out lots of rf. I even had some QSOs with amateurs down in the US. There was what I thought to be a problem with the BLT tuner. I was not happy with it's performance (or lack thereof). In messing around with it, I have now lost my transmit.

The symptom is.....when I power up the rig it receives great but I cannot key it anymore.

I was really looking forward to using this rig but must admit that circumstances in my life right now do not afford me the patience to deal with this glitch.

I'm willing to entertain any reasonable offers on this potentially great little rig.

Please check out my QRZ page where I chronicled part of the build, right up to the point where I was making my first contacts.

Ed, Thanks for your offer! ...Actually I was hoping to find the entire PFR-3b radio (the later model/version with encoder knob) ...I hadn't thought about trying to put an encoder with driver in my existing PFR-3a ...not sure there's room? Have to take a look and see. Might be possible?

Using the existing up/down PBs is just fine for casual OP but when I'm on a SOTA activation and I come up on a band I like to quickly tune up and down the band to see what shape it's in before launching a signal. Using the PBs switches seem a little slow for this purpose. So the knob would be nice feature.

Hi Steve, Yes I see your point about the tuning rate - makes sense. Mine has the PBs, but if you want to try adding the rotary encoder to it, that sound like a fun project.

Let me know. If you want it, it's yours.

There is also provision to enter the frequency with the paddle. At least my early model does this. I tend to only need this feature on 40m. Other than this the clock radio style tuning isn't so bad.

Curt

It’s not possible to add an encoder to the PFR3a. I had to re-arrange ports and do some things differently to free up the ports needed to add the encoder on the 3B. The 3B uses a different board layout and firmware.

It is possible to add another processor to decode the encoder and to “push” the buttons, but it won’t tune any faster then it would if you held down the button. In fact slower, since you no longer have the fast tune mode by holding the button down.
Steve KD1JV

Steve,

Thanks for the heads up on the encoder not being an option or benefit in my case. Would this also apply to the MTR2/3/5s as well?

I notice on my Tri-Bander the encoder and display play well together. You're right having the bigger steps / faster tuning is a nice feature!

Hi all,

After many MANY years of success (50+) with the hobby and realizing every goal I set, I found recently that my heart was back at square one and I decided to hit the airwaves in qrp mode. I have so many memories of working with low power as a novice in the early 60's where nothing came easy. I know that many of you can relate 110% with what I'm saying.

So I've run into some problems with my new PFR kit. I may draw the line and have someone repair it for me just because I'm too darn busy for my own good but I'm not ready to go there right now.

I've been troubleshooting for quite a few days now. I found that my hands shake a bit more than I want to admit and that my eyesight is fading as well hi hi. Initially I found cold solder joints but no misplaced parts. Inspecting further I found more solder joints that might be questionable and repaired them.

So now when I power up the rig, I get a normal sequence on the LED display, I have sidetone (keying circuit works with a paddle), the encoder changes the frequency displayed, I can adjust the keying speed with the menu button, etc, the volume pot seems to raise and lower the tiny noise I can hear through earphones, but I can't peak receive using an antenna and I have abnormal voltage on U5: Pin 6 is 4.9v and Pin 7 is 4.4v (both 1v low). Additionally, as the radio remains on power for about 60-90 seconds, the tiny noise in the earphones disappears and is replaced with scratchy noise and the keying side tone fades away to nothing and the encoder becomes inconsistent to change the frequency displayed. All other IC voltages are nominal. Powering down and back up again immediately causes the bad behavior to continue, but the tiny noise in the earphones and keying and rotary frequency changing function returns after the unit has been not powered for an hour or more.

Any ideas?

Thanks and 73's

Jim,

It sounds like an electrolytic capacitor maybe in backwards, probably one of those around the audio amp, U1. Check them all to be sure. Electrolytics can draw excessive current when backwards and that can cause overheating and odd behavior.

Make sure you have U5 plugged in the correct direction.
Make sure all the pins on the IC sockets are poking through the bottom.

Contiune to look for iffy solder connections and look closely at the magnet wire connections on the toroids.

Usually the problem is in only a few places, but of course, the trick is narrowing it down to those places.

Steve KD1JV

Jim

Sounds like you may be close. receiver issue could be a coil not properly soldered through insulation or maybe not having settings right on the antenna tuner. Also make sure you don't accidentally have a short somewhere.

Try touching each crystal in case one is not connected.

Maybe Dale can help interpreting the bias voltage.

Curt

4961. Powerpole Connectors

Yahoo group: pfr3_group
Date: 2017-12-26 21:48:38 UTC
From: va3kot@...
Topic: 4961 Message: 4961

After reading the recent post about hooking up the BNC connector with coax, I took a good look inside my radio. I saw the regular hookup wires connecting the BNC connector to the PC. I also saw that the wires between the PCB and the DC power barrel connector were very long and ran quite close to the RF output wires to the BNC. What a perfect little setup for internal RFI problems!

Fix #1 was to replace the regular hookup wires going to the BNC with a short length of RG-174.

Fix #2 was to eliminate the long wires going to the DC barrel connector. Instead I drilled a small hole in the side of the case adjacent to where the DC power connects to the PCB. I then ran the DC power wires through the hole to an Anderson Powerpole connector fixed to the outside of the case. The DC leads are now only a couple of inches long and less likely to pick up stray RF. I prefer Powerpole connectors to barrel connectors anyway.

While studying the inside of my radio, I noticed the internal battery holders are not fuse-protected. I don't usually use the internal batteries anyway because it is a lot of trouble to open the case to replace them and I am sure to lose the screws out in the field. My next mod will be to add internal battery fuse protection - just in case.

Still loving this little radio!
John, VA3KOT

4962. For Sale: PFR3-A

I'm selling my almost unused PFR3-A. Nothing wrong with it - I'm just looking to clean out the shack a bit and pick up a new rig. The SYL has some idea that our finances are finite, and I just can't convince her that doesn't apply to radio gear!

I built this rig myself a few years back, and Dale Putnam tested it and found it to be at or above factory spec. He has generously offered to extend the warranty to the buyer. I took the CWOps CW Academy a few years back, and the week afterward my work commitments picked up so I've not been able to get on the bands on CW. The PFR has been used to listen on occasion, but it's never left the shack other than for Dale to bench test. I'd consider it brand new, myself ;)

Contact me at k7jto.john@gmail.com to discuss and/or make an offer.

Update: PFR3 is still available - I built this rig a few years ago, and subsequently had it bench tested by Dale Putnam. Dale has offered to extend the warranty to the next owner. If you were looking for a PFR3, or considering building it yourself, here's a basically brand-new rig, with known bench specs.

$275 shipped to the continental US (that's the same price as the kit).
